1 WON Linear Motion Guide

1. Features

Linear Motion Guide is a linear motion bearing with the structure in which rolling elements such as balls or rollers softly circulate the inner part of a block that can make an infinite linear motion along the raceway surface of a rail.

The device is able to do rolling motion ideally, bearing high load and 4-direction equal load with high rigidity. With its auto-adjusting ability, the linear motion guide is excellent at error-absorbing and improves its precision after assembly. Since it has low frictional force and less abrasion, it is possible to maintain precision long and to drive silently at high-speed running.

2. Strengths

1) Able to make precise positioning

   Since there is less difference between static friction and kinetic friction as well as in speed-induced friction fluctuation, it excellently responds even to micro-migration, allowing precise positioning and high-speed running.

2) Able to maintain stable precision for a long time

   Less friction coefficient and wear due to ideal rolling motion makes it possible to maintain stable precision for a long time.

3) Able to eliminate clearance or increase rigidity by preloading

   It is possible to eliminate clearance by using rolling elements such as a ball or a roller, or to increase rigidity of Linear Motion Guide by preloading.

4) Simple lubrication

   Lubrication is simple, and it is convenient to maintain the device with grease or oil.

5) Able to make compact equipment and save the cost for operating electricity

   The device is able to bear high load with high rigidity and has low friction. Therefore, it is possible to design compact and miniaturized equipment and to save manufacturing costs and energy.

CHIARAVALLI®
LINEAR CENTER

3. Types

WON ST offers various types of linear motion guide from miniature types to general ball linear motion guide to low-noise linear motion guide to ultra-high rigid roller linear motion guide. Since each one supports different shapes and sizes according to service conditions, you can select the optimal linear motion guide suitable for each usage.

Linear Motion Guide		•World standard ball linear motion guide •4-direction equal load type with 45° contact angle •Great error-absorbing ability with D/F combination •Linear motion with high rigidity and high precision through ideal rolling motion
Wide Linear Motion Guide		•4-direction equal load type with 45°contact angle; a low-centered structure with a wide and short rail; the moment working at a narrow space; usable as an one-axis type where high rigidity is required; a device with linear motion
Spacer Chain Linear Motion Guide		World standard ball linear motion guide •4-direction equal load type with 45°contact angle •Great error-absorbing ability with D/F combination •A spacer ball chain based retainer type; a linear motion device generating low noise and low dust
Miniature Linear Motion Guide		•Miniature high-rigidity •Various shapes and sizes •A compact linear motion device with high durability and reliability
Roller Linear Motion Guide		•Roller-enabled ultra-rigid linear motion guide •4-direction equal load type with 45°contact angle •Able to run reliably for a long time through rolling motion having the wide contact surface •A linear motion device with high rigidity and high precision, and bearing high load

CHIARAVALLI®
GROUP SpA
2 Selection of Linear Motion Guide

1. Overview

To select a linear motion guide, it is necessary to identify the details of requirements, prioritize them, and then choose the one that meets the service conditions.

2. Procedure

1 Identify service conditions	equipment, maintenance structure, installation space, assembly status, functional requirements, service conditions
2 Select a type of Linear Motion Guide	Select an appropriate type by considering motion condition, load level, rigidity, friction, and assembly.
3 Select the model number of Linear Motion guide	Determine a model number and a quantity of blocks by considering such factors as assembly space and load.
4 Calculate loads	Calculate the loads of the vertical and horizontal directions and moment, which are imposed on a block.
5 Calculate equivalent load	Convert each load imposed on a block into an equivalent load.
6 Calculate mean load	Convert each load imposed on a block and the variable load during acceleration or deceleration into a mean load
7 Calculate static safety factor	Calculate a static safety factor identified with basic load rating and max. equivalent load. Check if it fits for service conditions.
8 Calculate life	Calculate a rated load and a life span. Check if the calculated life span fits for service conditions.
9 Review preload & clearance	Select the preload and clearance suitable for service conditions.
10 Determine the class of precision	Determine a class of driving precision required by Linear Motion guide
11 Lubrication, dust proof, surface handling	Select the lubricant suitable for the environment using grease, oil, or special grease lubrication. Select a dustproof seal. Determine the surface treatment for rust prevention for generating low dust.
12 Complete selection	Decide the final specifications of Linear Motion guide.

3 Life Calculation

1. Load rating and life

1) Life

If external load is applied to linear motion guide in driving, fatigue fracture occurs due to the stress made as load is repeatedly applied to the raceway surface and rolling elements, and peeling off scale-like flakes (flaking) arises. Life of a linear motion guide refers to a total driving distance until the point that flaking arises due to initial fatigue fracture.

• A linear motion guide can have defects earlier than the time of normal flaking caused by its wear or fatigue in the following cases:

> a. Excess load by the imprecise assembly following a difference in temperature or tolerance
>
> b. If a linear motion guide is contaminated with foreign substances
>
> c. Driving with insufficient lubrication
>
> d. Reciprocating motion in a very short distance in the form of vibration or wave during halting or driving
>
> e. Excessive load imposed on a linear motion guide
>
> f. Deformation of plastic end-plate

2) Rating fatigue life L

Generally linear motion guide does not always have an equal life span even though its products are manufactured in the same way, because of the difference in scattering of original fatigue of rawmaterial. For this reason, the reference value of life of a linear motion guide is defined as the rating fatigue life which is a total driving distance that 90% of linear motion guides in one group with the same specifications can reach without flaking at the time when all in the group run under the same conditions.

When using a ball
$$L= \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P_c} \right)^3 \times 50$$

When using a roller
$$L= \left(\frac{f_H \cdot f_T \cdot f_C}{f_w} \cdot \frac{C}{P_c} \right)^{\frac{10}{3}} \times 100$$

3) Basic dynamic load rating C

Basic dynamic load rating is a ability of linear motion guide to bear load, which represents an applicable constant load in direction and magnitude when the rated fatigue life is 50Km. The reference value of basic of WON linear motion guide dynamic load rating is 50Km (ball type) and 100Km (roller type), respectively. It is used for calculating of life a linear motion guide while driving under constant load in magnitude from the center of a block to bottom. Each value of basic dynamic load rating (C) is described in the catalogue

4) Basic static load rating C0

If a linear motion guide is applied by excessive load or instantly by big impact load, partially permanent deformation occurs between a rolling element and the raceway surface. If deformation reaches to a certain extent, it hinders smooth driving.
Basic static load rating is defined as the constant static load in direction and magnitude when the total permanent deformation of the raceway surface of block and rail and of a rolling element like a ball or a roller is 0.0001 times bigger than the diameter of the rolling element. In a linear motion guide, it refers to the load applied from top to bottom based on the center of a block.
Each value of basic static load rating (C0) is described in the specification table.
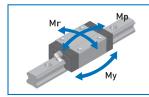

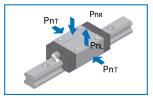

5) Static allowable moment M0
Moment load can be imposed on a linear motion guide. At this time, a ball or a roller both at the ends is most stressed due to the stress distribution of a ball or a roller as a rolling element in the linear motion guide. Static allowable moment (M_0) refers to the constant moment load in direction and magnitude when the total permanent deformation of a ball or roller, a rolling element to which the biggest stress is applied, and of the raceway surface of a block or rail is less than 0.0001 of the diameter of the rolling element. Moment values of three directions (M_p, M_y, M_r) are described in the catalogue. Static allowable moment (M_0) and static moment load rating (M_p) can be reviewed with application of safety factor (f_s)

Directions of
load and moment

$$f_S = \frac{M_p}{M_0}$$
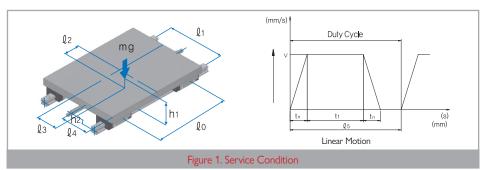

2. Load calculation

A linear motion guide bears basic dynamic load rating (C) and basic static load rating (C_0). Neverthe less, it also needs to bear compression load applied from top to down due to inertia force created by the center of gravity, positioning thrust, acceleration, cutting force, and deceleration as well as various loads including tensile load, horizontal load, and moment load, depending on the service conditions. In this case, load of the linear motion guide changes. To select a linear motion guide, it is required to review these conditions and calculate a proper load.

3. Service condition setting

Service conditions necessary for calculating the load and life of a linear motion guide.

Mass :	m(kg)	Velocity diagram	Velocity :	V(mm/s)
Applicable load direction :			Time constant :	t_n(s)
Point of application :	ℓ_2, ℓ_3, h_1(mm)		Acceleration :	a_n(mm/s²)
(center of gravity)		No. of reciprocating motions per minute :		N_1(min⁻¹)
Point of thrust :	ℓ_4, h_2(mm)	Stroke :		Ls(mm)
Composition of linear motion guide :	ℓ_0, ℓ_1(mm)	Avg. velocity :		Vm(m/s)
(No. of blocks & rails)		Required life :		Lh(h)

Figure 1. Service Condition

4. Load calculation formula

The load applied to a linear motion guide changes depending on external forces such as the center of gravity, position of thrust, acceleration, and cutting resistance. To select a linear motion guide, it is required to calculate the load applied to a block in full consideration of the conditions shown below.

m	: Mass	(kg)	g	: Acceleration of gravity (g : 9.8m/s^2)	(m/s^2)
ℓ_n	: Mass	(mm)	V	: Velocity	(m/s)
F_n	: Thrust	(N)	t_n	: Time constant	(s)
P_n	: Load (vertical, reverse-vertical)	(N)	a_n	: Velocity	(m/s^2)
P_{nT}	: Load (horizontal)	(N)

5. Equivalent load calculation

There are diverse kinds of load imposed on a block in a linear motion guide, such as compression load in vertical direction, tensile load, horizontal load, and moment load. There is also complex load of them. Sometimes the magnitude and direction of load change. Since it is difficult to calculate the variable load when calculating the life of the linear motion guide, it is required to use the equivalent load converted into the compression load or tensile load in vertical direction in order to calculate the life or static safety factor.

6. Equivalent load calculation formula

If a linear motion guide bears vertical compression load or tensile load or horizontal load simultaneously, or if the magnitude or direction of load changes, an equivalent load is calculated in the following formula.

P_E(Equivalent load) = P_n + P_{nT}

P_n : Compression load
P_{nT} : Horizontal load

P_n : Compression load
P_L : Tensile load
P_{nT} : Horizontal load
M_p : Pitching moment
M_y : Yawing moment
M_r : Rolling moment

Figure 2.

CHIARAVALLI
GROUP SpA

CHIARAVALLI®
LINEAR CENTER

7. Static safety factor calculation

Any unexpected big load may be applied to a linear motion guide due to the inertia force caused by vibration impact or quick braking and moment load of mechanical structure. To select a linear motion guide, it is required to take into account static safety factor and prepare for such load. Static safety factor (fs) is the value obtained by dividing basic static load rating by the calculated load. To see the baseline of static safety factor by service condition, please see Table 1-1 and Table 1-2.

Table 1-1. Baseline of static safety factor(fs)

Type of rolling element	Service condition	Static safety factor (fs)
Ball	There are no vibration and impacts.	1.0 ~ 1.5
	High driving performance is needed.	1.5 ~ 2.0
	There are moment load, violation, and impacts.	2.5 ~ 7.0
Roller	There are no vibration and impacts.	2.0 ~ 3.0
	High driving performance is needed.	3.0 ~ 5.0
	There are moment load, violation, and impacts.	4.0 ~ 7.0

Table 1-2.

If compression load is big	$\dfrac{f_H \cdot f_T \cdot f_C \cdot C_0}{P_n} \geqq f_s$
If tensile load is big	$\dfrac{f_H \cdot f_T \cdot f_C \cdot C_{0L}}{P_L} \geqq f_s$
If horizontal load is big	$\dfrac{f_H \cdot f_T \cdot f_C \cdot C_{0T}}{P_{nT}} \geqq f_s$

f_S : Static safety factor

C_0 : Basic static load rating(vertical) (N)

C_{0L} : Basic static load rating (reverse-vertical) (N)

C_{0T} : Basic static load rating (horizontal) (N)

P_n : Calculated load (vertical) (N)

P_L : Calculated load (reverse-vertical) (N)

P_{nT} : Calculated load (horizontal) (N)

f_H : Hardness factor

f_T : Temperature factor

f_C : Contact factor

8. Mean load calculation

The load applied to a block of a linear motion guide is not constant but differs according to service conditions. Therefore, the load that becomes equal to life under the condition of variable load is used. This is called mean load. If the load applied to the block is changed due to an external condition, it is required to calculate a life with the mean load in consideration of the various conditions shown below. If load applied to block varies in different conditions, it is necessary to a life in consideration of the condition of variable load. Mean load (Pm) refers to constant load that becomes equal to the life under the conditions of variable load when the load applied to a block changes in various conditions while the device is driving.

$$P_m = \sqrt[i]{\frac{1}{L} \cdot \sum_{n=1}^{n} (P_n^{\ i} \cdot L_n)}$$

Pm : Mean load   (N)
Pn : Variable load   (N)
L   : Total travel distance   (mm)
Ln   : Travel distance by loading P_n (mm)
i : Ball - 3, Roller - 10/3

Note) the formula above or formula (1) below is applied to a ball type only.
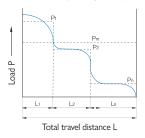

1) Change in phase

$$P_m = \sqrt[3]{\frac{1}{L} (P_1^{\ 3} \cdot L_1 + P_2^{\ 3} \cdot L_2 \cdots + P_n^{\ 3} \cdot L_n)} \cdots (1)$$
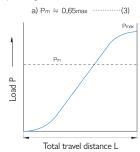

Pm : Mean load   (N)
Pn : Variable load   (N)
L : Total travel distance   (mm)
Ln : Travel distance by loading Pn   (mm)
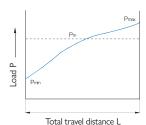

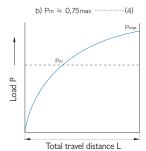

2) Change monotonously

$$P_m \simeq \frac{1}{3} (P_{min} + 2 \cdot P_{max}) \cdots (2)$$

Pmin : Minimum load   (N)
Pmax : Maximum load   (N)

3) Change in a sine curve

a) $P_m \simeq 0.65 max$ (3)

b) $P_m \simeq 0.75 max$ (4)

9. Rating life calculation

A rating life needs to be calculated because life of a linear motion guide differs even under the same driving conditions. Rating life of a linear motion guide is a total travel distance that a linear motion guide system composed of a certain number of units can drive without flaking in 90% of the race way surface or rolling element after being run under the same working conditions. If a ball or a roller is used as a rolling element, it is possible to calculate a rating life in the following formula.

The formula to calculate the rating life of a ball-enabled linear motion guide

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^3 \times 50$$

L : Rating life   (km)
C : Basic dynamic load rating   (N)
P_C: Calculated load   (N)
f_H : Hardness factor   See Figure 3
f_T : Temperature factor   See Figure 4
f_C : Contact factor   See Table 2
f_W : Load factor   See Table 3

The formula to calculate the rating life of a roller-enabled linear motion guide

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^{\frac{10}{3}} \times 100$$

L : Rating life   (km)
C : Basic dynamic load rating   (N)
P_C: Calculated load   (N)
f_H : Hardness factor   See Figure 3
f_T : Temperature factor   See Figure 4
f_C : Contact factor   See Table 2
f_W : Load factor   See Table 3

If the length of stroke and the number of reciprocating motions are constant, it is possible to calculate a life time with the use of the rating life (L) in the following formula:
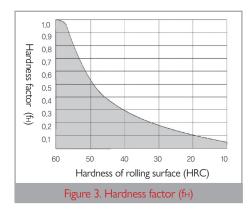

$$L_h = \frac{L \times 10^6}{2 \times \ell_s \times n_1 \times 60}$$

L_h : Life time   (N)
ℓ_s : Length of stroke   (mm)
n_1 : No. of reciprocating motions (min^{-1})

1) Hardness factor (fH)

To implement the best performance of a linear motion guide, it is necessary to maintain appropriately the hardness and depth of the raceway surface of the block and rail that contact a rolling element (ball or roller).
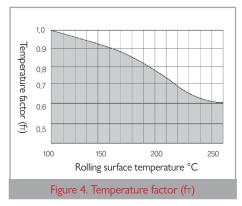

WON linear motion guide has HRC58-64 surface hardness. There is no need to consider hardness factor. If the hardness is lowered than a baseline, load capacity of a linear moti on guide decreases. In this case, it is necessary to apply hardness factor to life calculation.

Figure 3. Hardness factor (fH)

2) Temperature factor (fT)

If high temperature over 100°C is applied to a linear motion guide, it is necessary to take into account temperature factor (fT) at the time when a liner motion guide is selected.

Please make sure to use WON linear motion guide at below 80°C. At over 80°C, please use a high-temp linear motion guide.

Figure 4. Temperature factor (fT)

Note) If ambient temperature is over 80°C, it is necessary to use the materials of seal, end plate, and support plate that have specifications for high temperature.

3) Contact factor (fC)

If over two blocks are closely assembled and mounted, uniform load may not be applied to the blocks due to difference among mounting surfaces. Therefore, it is required to multiply basic static load rating (C) and basic dynamic load rating (C0) by the contact factor shown in Table 2.

Table 2 .

N° of blocks in close contact	Contact Factor (f$_c$)
2	0,81
3	0,72
4	0,66
5	0,61
Over 6	0,6
Common use	1,0

CHIARAVALLI GROUP SpA

4) Load factor (fw)

Generally the static load applied to the block of a linear motion guide can be calculated in formula. However, while a machine is running, the load applied to the block tends to come from vibration or impacts. Therefore, as for the vibration or impact load at high-speed running, it is necessary to consider the load factor (fw) shown in Table 3. Divide the basic dynamic load rating of a linear motion guide by a load factor (fw).

Table 3
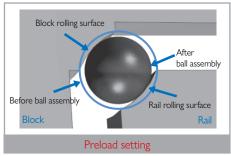

External condition	Service Conditions	Load factor
Low	Smooth running at mild speed; no external vibration or impacts	1.0 ~ 1.3
Moderate	Low speed; moderate external vibration or impacts	1.2 ~ 1.5
High	High speed; strong vibration or impacts	1.5 ~ 2.0
Very high	Very high speed; strong vibration and impacts at running	2.0 ~ 4.0
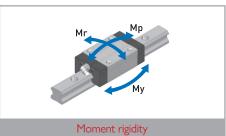

4 Rigidity and Preload
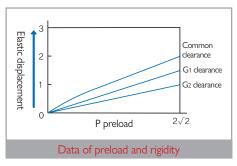

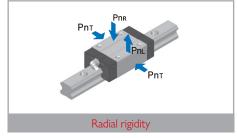

1. Preload

A linear motion guide is preloaded in a way that it improves mechanical precision by eliminating clearance using the rolling element (ball or roller) inserted into the space between a rail and a block or in a way that it applies load to the rolling element in advance by inserting the rolling element larger than the clearance of the raceway between a rail and a block. This process will enhance the rigidity of the linear motion guide and will lessen the displacement level caused by external load.

Preload setting

Data of preload and rigidity

Moment rigidity

Radial rigidity
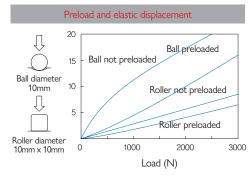

2. Radial clearance

Radial clearance refers to a total travel distance in a radial direction from the center of a block of a linear motion guide when mild load is applied to the block up and down from the center part of the rail length after the block is assembled in the rail which is then fixed to base. Radial clearance is usually classified into common clearance (no symbol), G_1 clearance (light preload), G_2 clearance (heavy load), and Gs clearance (special preload), which is selectable depending on usage. The values are standardized by form.

Preload and elastic displacement

Ball diameter 10mm

Roller diameter 10mm x 10mm

Type		Preload symbol	preload
H	Moderate	No symbol	$0 \sim 0.03 \times C$
	Light	G_1	$0.04 \sim 0.08 \times C$
	Heavy	G_2	$0.09 \sim 0.13 \times C$
S	Moderate	No symbol	$0 \sim 0.03 \times C$
	Light	G_1	$0.03 \sim 0.05 \times C$
	Heavy	G_2	$0.06 \sim 0.08 \times C$
R	Light	G_1	Equivalent to 0.03C
	Heavy	G_2	Equivalent to 0.08C
	Special	G_3	Equivalent to 0.13C

Table 4. Service conditions for radial clearance (preload)

Type	Preload status	Symbol	Service conditions	Use
1. Moderate	Plus-minus clearance	No symbol (1)	· Load is applied in uniform direction and smooth running is needed · There is almost no vibration or impact and precise running is required.	Welding machine, textile machinery, packaging machinery, various conveyors, medical equipment, woodworking machine, glass cutting machine, take-out robots, ATC, winding machine
2. Light	A small amount of minus clearance	G_1 (2)	· There is a little vibration or impact, and moment load · Light load is applied, yet high precision is required	Various industrial robots, measuring equipment, inspection equipment, 3D processor, laser processor, PCB drilling machine, various assembling machines, electric spark machine, punching press
3. Heavy	A large amount of minus clearance	G_2 (3)	· There are mild impact load, overhang load and moment load. Rigidity and high precision are required.	CNC lathe, machining center, milling machine, grinding machine, tapping center, drilling machine, hobbing machine, a variety of special equipment
4. Special	A small or large amount of minus clearance	Gs (4)	· Smaller clearance than that of G_1 preload; light and precise operation is required. · Larger preload than that of G_2; impact load and complex load; high strength and high rigidity are needed.	No preload, ultra-light preload, larger-than-moderate preload, special preload customized to user conditions, special processing machine for heavy-duty cutting

Note (1) No clearance or very small clearance.
(2) Very small minus clearance
(3) Quiet large minus clearance to enhance rigidity
(4) Preload below G_1 or over G_2 to meet service conditions

LINEAR CENTER

5 | Friction

1. Friction

Friction of a linear motion guide resistance is about 1/20-1/40 of an existing sliding guide be cause a rolling element (ball or roller) is assembled in between a rail and a block which is the raceway surface. In addition, the device has low starting torque because the difference between static friction and kinetic friction is very small. low power loss and temperature rise in the part of linear motion are of advantage to speedy operation. high conformability and response make it possible to do high-precise positioning.

2. Friction coefficient

Friction of a linear motion guide resistance relies on the load applied to the linear motion guide, speed, lubrication or form. In the case of light load or speedy motion, lubricant or seal is the main cause of friction resistance. In the case of heavy load or slow motion, the magnitude of load affects friction resistance.

$$F = \mu P$$

F : Friction resistance   (N)
μ : Kinetic friction factor
P : Load   (N)

P : Load
C : Basic dynamic load rating

Figure 5. Relation between load ratio and friction factor

Common friction coefficients of various operating systems are shown below in the table, and are applied if there are appropriate lubricant or assembly and normal load.

Type of operating system	Major model number	Friction factor μ
Linear Motion Guide	H, H...S, HB, S, S...S, HS, HS...S, M, MB	0.002 ~ 0.003
	R, RS	0.001 ~ 0.002
Ball Spline	WLS, WSP	0.002 ~ 0.003
Super Ball Bushing / Linear Ball Bushing	SB, SBE, LM, LME	0.001 ~ 0.003
Cross Roller Guideway	WRG	0.001 ~ 0.0025

6 Precision
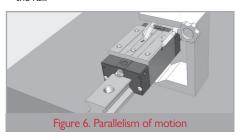

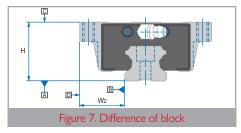

1. Precision specification

How to measure degree of a linear motion guide of travel is as follows (See Figure 6).
a. Tighten the rail to the mounting surface of the bed with a bolt at the defined torque.
b. Draw a measuring jig right up against the datum plane of the block as shown in the figure.
c. Make a measurement by making the block and measuring jig travelled in the entire section from the starting point to the end point of the rail.
d. The value measured in the above way is an error of parallelism of motion that the block has on the basis of the rail.

Figure 6. Parallelism of motion

The degree of parallelization between the datum plane of the

Figure 7. Difference of block

CHIARAVALLI GROUP SpA

7 Lubrication

1. Purpose

The purpose of lubricating a linear motion guide is to create an oil surface between the raceway surface of rail and block and a rolling element so as to avoid the direct contact of metals, and thereby to reduce friction, wear and heat, preventing the raceway surface and the rolling element from being overheated and melted to be adhered to each other. Moreover, the oil surface created between the raceway surface and a ball decreases load-induced contact stress, so that it can improve the rolling contact fatigue life and prevent rust. A linear motion guide is equipped with a seal. Nevertheless, grease inside the block oozes while the device is in operation. For this reason, it is required to supply a lubricant at a time and interval appropriate to each service condition.

2. Selection of lubricant

To achieve the best performance of a linear motion guide, it is necessary to select the lubricant suitable for service conditions. Lubricants used for a linear motion guide include grease and oil. It is possible to select an appropriate lubricant and lubrication method depending on service conditions, load, operating speed, assembly type, etc.

3. Grease lubrication

Grease is a semisolid lubricant that consists base oil , thickener, and additives.
Generally, when a linear motion guide is lubricated with grease, lithium soap grease is used. In the con dition of high load or the condition of use, the grease mixed with extreme-pressure additive is used. To apply a linear motion guide to a high-vacuum environment or a cleanroom, it of desirable to select a type of grease excellent at low evaporation and low dust generation.

1) Grease refilling
For grease refilling in a linear motion guide, it is necessary to supply a sufficient amount of grease with the use of a grease nipple until remaining grease is discharged. It is appropriate to fill up 50% or so volume block with grease. After refilling, rolling resistance can be increased. In order to reduce the rolling resistance, it is better to take a test run about 20 times prior to the operation.

2) Refill interval
If a travel of linear motion guide exceeds a certain time, its lubricating performance declines. So it is re quired to supply an appropriate amount of grease at a proper time depending on service conditions and environment. Usually, it is necessary to supply grease when travel of the device distance reaches 100km.

$$T= \frac{100 \times 6000}{Ve \times 60} \ hr \qquad \text{T : Oil refilling cycle (time) Ve : Velocity (m/min)}$$

4. Oil lubrication

When a linear motion guide is lubricated with oil, it is recommended to use an oil lubricant with high viscosity (68mm^2 /sec) under the condition of high load, and an oil lubricant with low-viscosity (13mm^2 /sec) under the condition of high velocity. As for oil lubrication, the recommended oil supply amount per block is 0.3cm^3 per hour.

Table 17. Inspection and refilling time of lubricant

Type	Checkpoints	Inspection cycle	Refilling time
Grease	•Check if there is any cutting chip, dust, foreign substance •Check if there is any contamination by other substances	3-6 months	•Generally, supply grease 1-2 times every year. •Usually, supply grease more than once every year if travel exceeds 100km/year. •Refill depending on a situation after checking the status of grease.
Oil	Check a lubricant quantity, contamination, and foreign substance	3-6 months	•Refill depending on the results of inspection, and determine an optimal amount depending on volume of the oil tank
	Check an oil level (Supply oil mist)	Before every operation	•Refill appropriately after checking how much oil is consumed. •Define an optimal amount after how much oil is consumed

Please DO NOT use any oil that affects synthetic resin, a material of linear motion guide parts.

Table 18. Lubricants used for linear motion guide

Application	Main use	Product name	Manufacturer	Manufacturer	Base oil	Type of thickener
Common use (extreme-pressure additive incl.)	Industrial machine, machine tool	BW EP NO.2	BWC	-20 ~+105	Mineral oil	Lithium
Common use	Machine tool, electric spark machine, industrial robot, etc.	GADUS S2 V220 00	SHELL	-30 ~+110	Mineral oil	Lithium
Clean & low dust generation	Semiconductor, FPD equipment	SNG 5050 DEMNUM	NTG DAIKIN	-40 ~+1200 -50 ~+300	Synthetic oil	Urea
Eco-friendly	Semiconductor AMOLED process equipment, driving gear in vacuum chamber	FOMBLIN Krytox High vacuum grease	AUSIMONT DuPont Dow Corning	-20 ~+250	Synthetic oil	Re-fluoride Ethylene fluorinated
Machine tool	Excellent dust prevention and strong oil film strength Hardly emulsified to clearance, so suitable for machine tools	VACTRA NO.2 SLC DTE Oil	ExxonMobil	-20 ~+100	Oil	Way oil Turbine oil
Special use	Corrosion proofing	6459 Grease	SHELL	-20 ~+100	Mineral oil	Polyurethane

8 Surface Treatment

1. Surface treatment

WON ST uses the following methods for the optimal surface treatment of a linear motion guide in order to prevent rust and improve the quality of its appearance.

2. Types of surface treatment

1) Electrolytic rust-preventive black coating (black Cr plating)

This is an industrial black chrome coating type that is used to improve the corrosion proof at low cost. It can achieve better corrosion proof than martensite stainless steel and be used to enhance appearance and prevent the reflection of light.

2) Industrial hard chrome plating

A hardness of surface is over 850HV, so that its wear proof is excellent and its corrosion proof is comparable with that of martensite stainless steel. WON ST offers such surface treatment types such as alkakine col oring and color alumite treatment at a customer request. To use a linear motion guide after its sur face treatment, it is necessary to set a high safety factor.

3) Fluoride low-temperature Cr plating

It is also called "Raydent." This is a combined surface treatment type of black Cr coating with special fluoride resin coating that is used in the places requiring high corrosion proof, or in cleanroom that needs to generate low dust.

9 Dust Proof

1. Dust proof

To make use of the characteristics and performance that a linear motion guide has, it is important to protect the device against external foreign substances which are causes of abnormal wear and its shortened life span. If any dust or foreign substance is expected to be mixed in, it is required to use an effective sealing or dust-proofing system.

2. Types of dust proof

WON Linear Motion Guide has basically a seal assembled. If necessary, it I possible to mount a metal scraper on the device before shipment.

1) Exclusive seal

In order to protect the inside of a bearing against foreign substances, an end seal and a side seal are installed on the both ends and bottom of a block, and an inner seal is mounted on the inside of the block.

2) Metal scraper

A metal scraper is installed outside an end seal, so that it is effective at protecting a device against foreign substances, such as hot spatter or slag generated in a welding process.

10 Measures for Use in Special Environments

WON Linear Motion Guide is useful in various special applications if being used appropriately in accordance with such service conditions as material, surface treatment, dust proof, and grease.

Table 19.

Application	Conditions of use	Measures	
Clean (Clean room) -Semiconductor, FPD, medical equipment-	•If used in a clean environment, it is required to minimize dust or particles generated in a linear motion guide, as most as possible.	Lubricant	•For a clean environment •Use the grease that generates low dust
		Rust prevention	•Black Cr coating •Fluoride low-temperature colorimetric Cr plating (Raydent treatment) •Use high-corrosion resistant stainless steel as a material
Vacuum -Semiconductor, FPD deposition equipment -	•If used in a vacuum environment that needs to maintain vacuum status, it is required to control the out gas discharged by a linear motion guide as most as possible. •Excellent rust prevention is required, since rust-prone parts cannot be used in this environment.	Lubricant	•Use the grease for a vacuum environment.
		Rust prevention (Out Gas)	•Use high-corrosion resistant stainless steel as a material •Use a self-oiling agent with special coatings like fluoroplastic coatin •Use ceramic as a material
High-temperature environment	•If used in a higher temperature environment than general one, where heat proof of a ma terial is important, it is re quired to use metals for plastic synthetic resin parts	Lubricant	•Use the grease for high- temperature.
		Material	•Use an end seal, side seal+ double seal. •Use a double seal. •Use a special seal for high temperature
Dust	•If used in an environment where there are a lot of cutting chips, wood dust, and dust, it is required to take dust proof measures to protect the block against foreign substances.	Seal	•Use a plastic synthetic resin cap •Use a metal cap •Use a metal scraper
		Cap	•Use a plastic synthetic resin cap. •Use a metal cap •Use a seal plate
		Holding door	•Use an exclusive holding door •Use an sealing and all-in-one holding door
Spatter	•If exposed to a spot welding or arc welding environment, it is required to take measures to prevent hot spatters from being fixed onto a rail	Spatter	•Fluoride black Cr coating
		Seal	•Use a metal scraper
		Dust resistance	•Use a metal cap •Use a seal plate

GROUP SdA
11 Placement and Installation

1. Placement and structure

To mount a linear motion guide on equipment, it is required to understand the overall structure of the equipment first, and then check the sizes of the base and a transfer table. To determine the optimal in stallation of a linear motion guide, it is necessary to take into account mounting directions such as placing vertically, in slope, or in the back, load, and the life span required.

Installation layout of linear motion guide (examples)

(1) Assembly of the top side of block, block transfer

(2) Assembly of the back side of block, rail transfer

(3) Assembly of the flank of rail, block transfer

(4) Assembly of the flank of block, rail transfer

(5) Assembly of the wall side of block, rail transfer

(6) Assembly of the wall side of rail, block transfer

(7) Symmetrical assembly of the top and bottom of block, block transfer

(8) Symmetrical assembly of the top and bottom of block, rail transfer

2. Mounting and fixation

In the structure affected by both vibration and impact, in the place that has complex load or moment load, it is required to fix a linear motion guide in a different way from a general one.

This is a widely used method. Push a pressure plate from the flank after slightly protruding a block and a rail. In this case, it is required to prevent the corners of the rail and block from being in contact with each other.
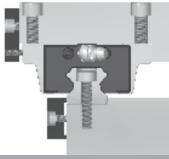

Figure 8. Pushing a pressure plate from the flank

This is a way of fastening a tapered fixture with a bolt. Even slightly bolting up generates big force in a horizontal direction. If it is bolted up too much, deformation may occur in rail, for instance, which needs to be taken a caution.
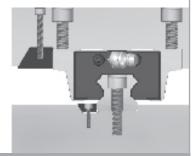

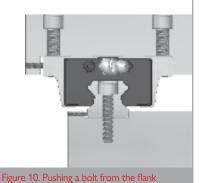

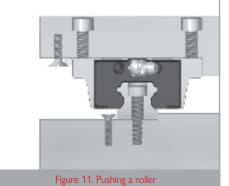

Figure 9. Pushing a tapered plate

You must be required to use miniature bolts due to the spatial constraint when a rail is pushed by a bolt. It is favorable to use as many bolts for pushing as possible.

Figure 10. Pushing a bolt from the flank

This is a way of pushing a needle roller with the head of a countersunk screw. It is careful to push it to fit the screw.

Figure 11. Pushing a roller
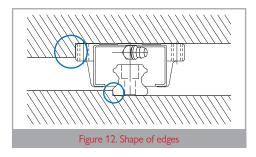

3. Design of the mounting surface for installation
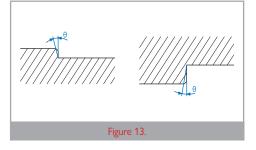

Design and management of the mounting surface

The precision of mounting surface of a linear motion guide and an error in installation cause unexpected load and stress to the device, negatively influencing the travel and life of the device. So, it is required to take caution to prevent the harmful effects.

Figure 12. Shape of edges
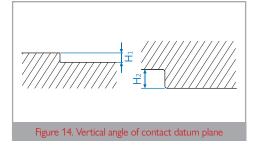

Management of the vertical angle of the datum plane for installation

If the vertical angle of the installation surface of a rail or block and of its datum plane is inaccurate, it might not be assembled precisely. So, it is required to review an error of vertical angel in design.

Figure 13.
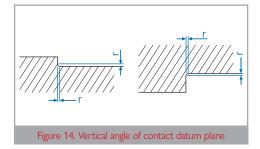

Management of the datum plane for assembly

In designing a linear motion guide, it is important to manage the height and thickness of its assembly datum plane. If the height is too high or low, a rail or a block may fail to be assembled precisely due to its surface attachment; the application of eccentric load, horizontal load and moment load may loosen the strength of joint and cause poor assembly. In this case, precision fails to meet the requirements in design. So, attention must be paid.

Figure 14. Vertical angle of contact datum plane

Management of the shape of contact corner

If the right-angled corner of a rail or block installed to the mounting surface of a linear motion guide is processed in R-shape and R value is bigger than the dimension of the surface of the rail or block, it is possible to cause a failure of precise assembly to the datum plane. So, attention must be paid.

Figure 14. Vertical angle of contact datum plane

Management of the dimensional tolerance between datum plane and bolt in design

If the dimensional tolerance between the contact datum plane of a rail or block of a linear motion guide and a mounting hole is too big, precise assembly fails. So, attention must be paid. Generally the dimensional tolerance is ±0.1mm as a reference value. If the distance tolerance between the assembly datum plane of rail or block and the assembly bolt hole is too wide or narrow, precise assembly may fail. So, it is required to set the tolerance to W3±0.1mm in design.
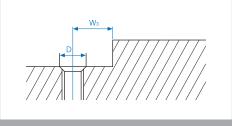

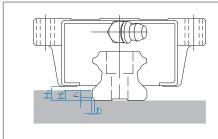

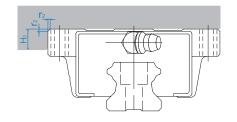

Figure 16. Dimensional tolerance between contact datum plane and mounting hole

Assembly of rail datum plane   Assembly of block datum plane

Figure 17. Height of the raised spot of mounting surface and radius of the corner R

- Make a datum plane that can contact the flank in order to secure the assembly convenience or precise position and the assembly surface of a rail or block in the installation process of a linear motion guide.
- The height of the raised spot of contact datum plane or the radius of corner depend on the specifications of a linear motion guide. So please see the table shown below.
- To prevent the raised spot from being deformed by the pressing force from above or pushing force from side, secure sufficient thickness in design.

4. Error tolerance of the mounting surface for installation

1) Auto-adjusting and error-absorbing abilities

A linear motion guide has an excellent auto-adjusting ability. Therefore, even though the structure with rail assembly is slightly deformed processing error may occur a little, the straightness or parallelism of a table after assembly is better than the precision in processing before assembly, and quite linear running is available.

2) Error tolerance of the degree of parallelization when using 2-axis assembly (P_1)

The error tolerance of the degree of parallelization when a 2-axis assembly is used is shown below

Figure 18. Error tolerance of the degree of parallelization (P)

3) Error tolerance of height in 2-axis assembly (P$_2$)

If an error of height in installation is too big, block distortion occurs and its rigidity may be weakened due to block distortion and changes in the raceway groove of the block and rail block and in the contact angle of a ball or roller as a rolling element.

The error tolerance of height level (x) when a 2-axis linear motion guide is used is as follows.

Figure 19. Error tolerance of height level in 2-axis (X)

5. Description of the datum plane for installation

The datum plane of WON ST Linear Motion Guide is the ground surface on the opposite side of WON mark shown in the block.

Figure 20. Linear motion guide on the reference axis

Figure 21. Linear motion guide on the driven shaft
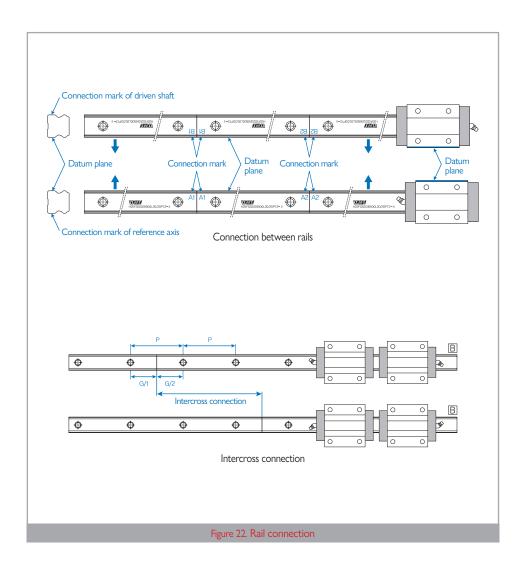

6. Rail connection

If it is necessary to use a longer rail than the one supplied, it is possible to connect rails for the purpose of use. The mark on the rail indicates the point where rails should be linked. If a block passes through the connecting points simultaneously, that may affect travel of the unit or cause a delicate hitch. To solve this problem, it is recommended to make the connecting points intercrossed.

7. Installation
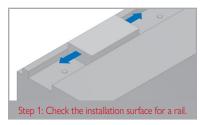

1) Installation of linear motion guide in the equipment exposed to vibration and impacts

Block push bolt

Rail push bolt

Table

Bed

Auxiliary axis

Reference axis

Install a rail
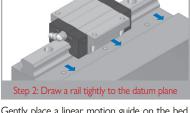

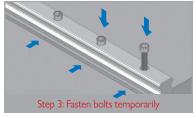

Step 1: Check the installation surface for a rail.
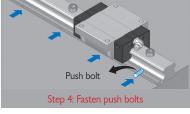

Prior to installation, remove burr, dust, and dust prevention oil completely.

Step 2: Draw a rail tightly to the datum plane
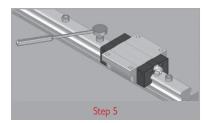

Gently place a linear motion guide on the bed, and push it in the opposite direction of datum plan of the bed.

Step 3: Fasten bolts temporarily

Check the status of bolts and fasten every bolt temporarily.

Push bolt

Step 4: Fasten push bolts

Fix push bolts to make sure that the rail is in parallel with the datum plane of the bed.

Step 5
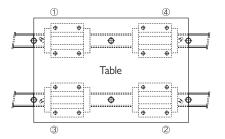

•Step 5: Fasten all bolts with a torque wrench.

Fasten all bolts at the recommended torque. Fasten the bolt in the center first and then continue fastening each bolt toward both ends in order to maintain precision of the rail in the assembly process.

•Step 6: Assemble an auxiliary axis.

Repeat the above procedure for the installation of an auxiliary axis.

Install a block

Table

- ①
- ④
- ③
- ②

•Step 1: Assembly bolts temporarily

Place a table on the block and fasten all bolts temporarily.
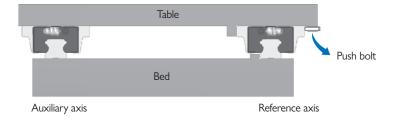

•Step 2: Fasten bolts tightly

Fix the main rail block to the opposite side of datum plane of the table with the use of a push bolt, and adjust position of the table.

•Step 3: Fix and fasten assembly bolts

Completely fasten all bolts on the datum plane and subsidiary side in the order of to .

2) Installation of linear motion guide without a push bolt

Table

Bed

Push bolt

Auxiliary axis

Reference axis
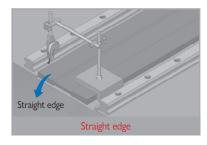

Install a master rail

Use a vise

Fasten bolts temporarily and push a master rail toward the datum plane using a C-vise. Fasten the bolts sequentially at the pre scribed torque.
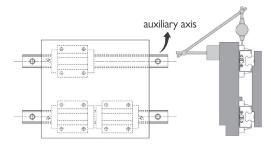

Install an auxiliary rail

Straight edge

Straight edge

Place a straight edge in between two rails, and make it in parallel with the master rail fixed temporarily. Check the degree of par allelism with a dial gauge, and adjust the rail if needed. And then, fasten bolts in order

auxiliary axis
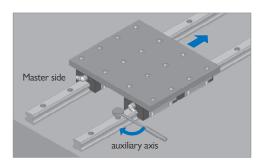

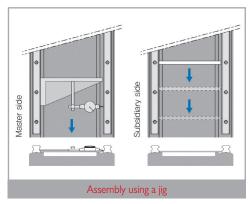

•Assembly using a table

1. Fix two blocks on the datum plane and one block on the auxiliary axis to a table.
2. Fix another auxiliary block and rail to the ta ble and bed temporarily.
3. Place a dial gauge on the table and make sure that a prober of the gauge contacts the auxiliary axis of the block.
4. Separate the table from the end of the rail, and check parallelization between the block and the auxiliary rail.
5. Fasten bolts in order.

Master side

auxiliary axis
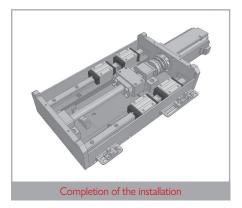

•Assembly using a rail on the reference axis

1. Fix two blocks on the datum plane and one block on the auxiliary axis to a table.
2. Fix another auxiliary block and rail to the ta ble and bed temporarily.
3. Separate the table from one rail and make adjustment in the way of parallelization with the auxiliary rail in consideration of rolling resistance in movement.
4. Fasten bolts in order.

Master side

Subsidiary side

Assembly using a jig

Completion of the installation
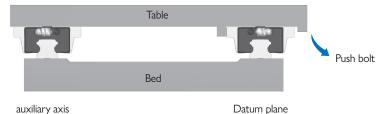

Move the postiion of a block sequentially at the end of the master rail every bolt pitch, and adjust parallelization between the datum plane of the master rail and the master plane of the auxiliary rail with the use of a special jig. Fasten bolts in order.
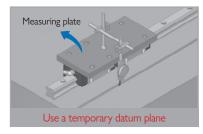

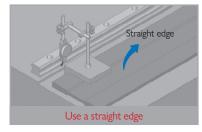

3) Installation of a block without the datum plane for a reference rail

Table

Push bolt

Bed

auxiliary axis   Datum plane

Install a reference rail

Measuring plate

Use a temporary datum plane

Straight edge

Use a straight edge

Fix two blocks together onto the meas uring plate and install a temporary datum plane near the rail mounting on the bed. Check the degree of parallelism of the rail, and fasten bolts in order.
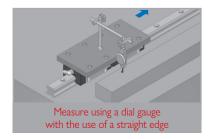

Fix a rail to the bed temporarily. Adjust it to be in straight life with the use of a dial gauge. Fasten bolts in order.

Apply the same method when installing an auxiliary block and rail.

4) Measure precision after installation

It is possible to check the precision of travel by fixing two blocks onto the measuring plate. To meas ure precision, either use a straight edge and check a measurement with a dial gauge, or use a laser interferometer.

Measure using a laser interferometer

Measure using a dial gauge with the use of a straight edge

GROUP SpA

8. Torque used for fastening bolts in assembly

1) Select the optimal torque for bolts

To assemble a rail of a linear motion guide, it is required to apply bolt torque appropriately in consideration of the material of the mounting surface or bolts. Inaccurate bolt torque may affect the mounting precision of the rail. So please use a torque wrench.

2) Recommended torque by the material of the mounting base

Unit : N·m

R-RN, R-RL, RS-RN, RS-RL

Since the square body of the block is tap-processed, it is used at the time when bolts need to be fastened from top to bottom as indicated by the arrow.

12 Types of Linear Motion Guide

1. Linear Motion Guide H Series

1) Structure of H Series

WON Linear Motion Guide H Series has a four-row circular arc-groove structure in the raceway groove of a rail or block. In addition, it has a 4-direction equal load type in which it can bear equal load rating for vertical compression load, tensile load, and horizontal load as its ball as a rolling element is combined at 45 degree. Therefore, the model reduces friction resistance and ensures smooth motion and long life. By imposing preload on the balls, it is possible to enhance the rigidity of a linear motion guide and to minimize its deformation for external load.

2) Features of H Series

a. High quality, high precision, and elimination of labor.

b. High rigidity and high precision for implementing stable travel precision for a long time.

c. Excellent wear resistance and friction resistance that ensure a long life.

d. The face-to-face duplex structure just like the D/F combination of ball bearing, excellent at auto-adjusting and error-absorbing.

e. Various specifications for easy design.

f. Easy to use due to high compatibility of rail and block.

2. Spacer Chain Linear Motion Guide H...SSeries

1) Structure of H...S Series

Like H Series, Linear Motion Guide H...S Series has the 4-direction equal load type and auto-adjusting face-to-face D/F structure. It uses a ball as a rolling element and has a spacer between balls to prevent them from colliding each other in rolling motion. Since it makes less noise and more stable circulating motion than a full-ball type, it is possible to implement quiet running at high speed. In addition, the spacer can serve as a pocket of a lubricant.
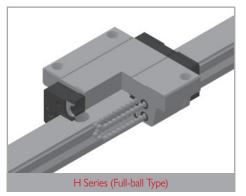

2) Features of H...S Series

a. As a spacer-incorporated type that improves frictional properties and prevents the collision of balls, the model not only allows stable circulating motion and smooth running but also reduces noise. By attaching a special lubricating seal for a longer life span, it is possible to be free of maintenance.

b. Since a resin spacer is applied to the model, it is possible to prevent the collision of balls and the loss of oil film, and to generate less particles and dust.

c. High quality, high precision, and elimination of labor.

d. High rigidity and high precision for implementing stable travel precision for a long time.

e. Excellent wear resistance and friction resistance that ensure a long life.

f. The face-to-face duplex structure just like the D/F combination of ball bearing, excellent at auto-adjusting and error-absorbing.

g. Various specifications for easy design.

h. Easy to use due to high compatibility of rail and block.

	H-FL H-FL...S	•The same cross section as in H-F Series; increased load rating by en larging the entire length (L1) of a block •4-direction equal load type with high ri gidity and high load S Series are types with a spacer retain er helping to reduce ball-to-ball friction and generate less noise and dust	
Compact type	H-R H-R...S	•A compact type with the tap-ma chined top of a block, minimizing the width (W) of a block •4-direction equal load type with high rigidity and high load S Series are types with a spacer retain er helping to reduce ball-to-ball friction and generate less noise and dust	
	H-RL H-RL...S	•The same cross section as in H-R Se ries; increased load rating by enlarging the entire length (L1) of a block •4-direction equal load type with high rigidity and high load S Series are types with a spacer retain er helping to reduce ball-to-ball friction and generate less noise and dust	

Standard and maximum lengths of a rail

3. Wide Linear Motion Guide HB Series

1) Structure of HB Series

WON Wide Linear Motion Guide HB Series has a four-row circular arc-groove structure in the raceway groove of a rail or block. In addition, it has a 4-direction equal load type in which it can bear equal load rating for vertical compression load, tensile load, and horizontal load as its ball as a rolling element is combined at 45 degree. Therefore, the model reduces friction resistance and ensures smooth motion and long life. Since the model has a wide and short rail, moment works only with one shaft in a narrow space. It is applicable to place that requires high rigidity.

2) Features of HB Series

a. High quality, high precision, and elimination of labor.

b. High rigidity and high precision for implementing stable travel precision for a long time.

c. Excellent wear resistance and friction resistance that ensure a long life.

d. The face-to-face duplex structure just like the D/F combination of ball bearing, excellent at auto-adjusting and error-absorbing.

e. A higher quantity of balls than that of H Series; higher rigidity and wider rail; sufficient moment working only with one shaft

4. Slim Linear Motion Guide S Series

1) Structure of S Series

Linear Motion Guide S Series has a four-row circular arc-groove structure and a 4-direction equal load type. It also has an auto-adjusting face-to-face D/F structure. Using a ball as a rolling element, the model is a slim-type guide with a low sectional height, high rigidity and less noise.

2) Features of S Series

a. High quality, high precision, and elimination of labor.

b. High rigidity and high precision for implementing stable travel precision for a long time.

c. Excellent wear resistance and friction resistance that ensure a long life.

d. The face-to-face duplex structure just like the D/F combination of ball bearing, excellent at auto-ad justing and error-absorbing.

e. Various specifications for easy design.

f. Easy to use due to high compatibility of rail and block.

g. 4-direction equal load and high-rigidity structure.

h. A slim shape suitable for horizontal motion, ensuring stable running.

5. Slim Spacer Chain Linear Motion Guide S...S Series

1) Structure of S...S Series
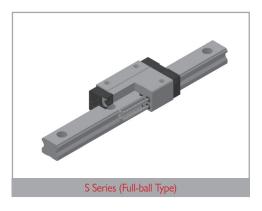

Like S Series, Linear Motion Guide S...S Series has the 4-direction equal load type and auto-adjusting face-to-face D/F structure. It uses a ball as a rolling element and has a spacer between balls to prevent them from colliding each other in rolling motion. Since it makes less noise and more stable circulating motion than a full-ball type, it is possible to implement quiet running at high speed. In addition, the spacer can serve as a pocket of a lubricant.
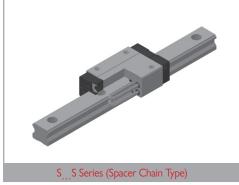

2) Features of S...S Series

a. As a spacer-incorporated type that improves frictional properties and prevents the collision of balls, the model not only allows stable circulating motion and smooth running but also reduces noise.

b. Since a resin spacer is applied to the model, it is possible to prevent the collision of balls and the loss of oil film, and to generate less particles and dust.

c. High quality, high precision, and elimination of labor.

d. High rigidity and high precision for implementing stable travel precision for a long time.

e. Excellent wear resistance and friction resistance that ensure a long life.

f. The face-to-face duplex structure just like the D/F combination of ball bearing, excellent at auto-ad justing and error-absorbing.

g. Various specifications for easy design.

h. Easy to use due to high compatibility of rail and block.

7. Miniature Linear Motion Guide M Series

1) Structure of M Series

WON Miniature Linear Motion Guide M Series has a shape of a gothic-arch groove in the raceway of a rail and a block and a 4-direction equal type structure with 2-row 4-point contact balls at 45 degree. This model, though small-sized, supports stable travel and high rigidity for variable load or complex load under which a direction or size changes.

2) Features of M Series

a. A compact and highly-rigid 4-direction equal load type.

b. A variety of specifications in consideration of space and load rating in order for easy design.

c. It is convenient to maintain balls at the time of block-rail assembly, for a block has the wire to prevent ball separation built in.

d. This model made of stainless steel is resistant for rust. Therefore, it is suitable in a rust-resistive envi ronment or the cleanroom that inhibits generation of particles.

8. Wide Miniature Linear Motion Guide MB Series
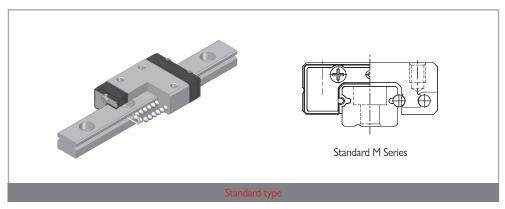

1) Structure of MB Series
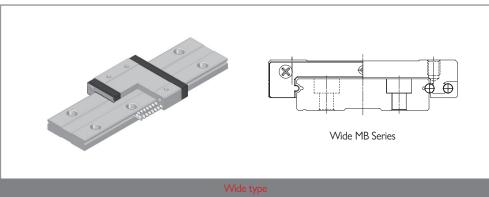

Like M Series, WON Miniature Linear Motion Guide MB Series has the 4-direction equal load type. As its rail and block get widened, the model improves basic load rating and moment load compared to M Series.
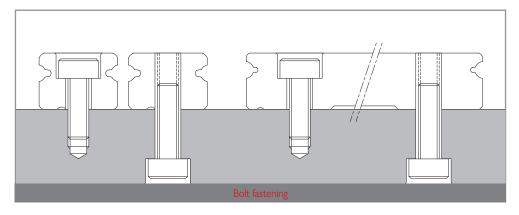

2) Features of MB Series

a. Wide block and rail, an increased number of effective balls, and improved load rating and moment load.

b. Wider than a general type of miniature linear motion guide, increased rigidity, and very favorable in the use of one axis.

c. A compact and highly-rigid 4-direction equal load type.

d. A variety of specifications in consideration of space and load rating in order for easy design.

e. It is convenient to maintain balls during block-rail assembly, for a block has the wire to prevent ball separation.

f. This model made of stainless steel is resistant for rust. Therefore, it is suitable in a rust-resistive envi ronment or the cleanroom that inhibits generation of particles. (The bearing steel materials for MB 12 and MB 15 are reserved.)

9. Roller Linear Motion Guide R Series

1) Structure of R Series
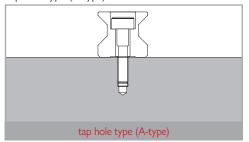

WON Linear Motion Guide R Series uses the roller in the raceway surface of a rail and a block as a rolling element, and its four-row cylindrical roller has the contact angle of 45° which makes it possible to bears vertical tensile compression load and horizontal load equally. In the model, a roller, a rolling element, has less elastic displacement than a ball so that its displacement by external load is low. Due to the wide area of contact between the raceway surface and a roller, it can bear high load with high rigidity. Therefore, the model has a long life span, and excellent impact resistance and wear resistance. In addition, since it has less friction resistance, it supports smooth motion and quiet running. By imposing appropriate preload on a roller according to use conditions, it is possible to enhance more rigidity of a linear motion guide.
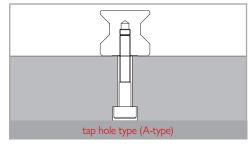

2) Features of R Series

a. High quality, high precision, and elimination of labor

b. High rigidity and high precision for implementing stable travel precision for a long time

c. Excellent wear resistance and friction resistance that ensure a long life

d. High rigidity and high load capacity, compared to ball type devices with the same model number

e. Low displacement for impact load or variable load, compared to ball type linear motion guides; excellent vibration resistance with a short vibration decay time for natural frequency

f. High basic load rating, compared to ball type linear motion guides with the same specification, makes it possible to support a compact design through the use of a smaller model number than that of a ball type device. In case of the same model number, it is possible to have a longer life span due to high load rating.

g. A variety of specifications for easy design

Cross Section

Types and Features
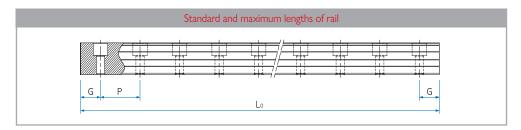

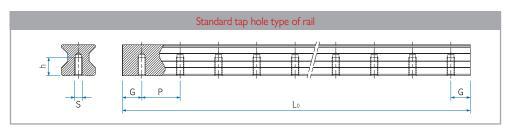

Category	Type	Shape & Feature	
Flange type	R-FN	• A roller type with the tap-processed flange of a block, supporting installation from bottom to top and from top to bottom • 4-direction equal load type with high rigidity and high load	Machine tool CNC machining center CNC tapping center NC milling machine Boring machine Multiple machining center Planner miller Large injection machine Heavy-duty cutting machine Wire-cut pentahedral processing center Display test equipment
	R-FN	• The same cross section as in R-F Series; a roller type with increased load rating by enlarging the entire length (L_1) of a block • 4-direction equal load type with high rigidity and high load	
Compact type	R-RN	• A compact type with the tap-processed top of a block, minimizing the width (W) of a block • 4-direction equal load type with high rigidity and high load	
	R-RL	• The same cross section as in R-R Series; a roller type with increased load rating by enlarging the entire length (L_1) of a block • 4-direction equal load type with high rigidity and high load

13 Options

1. Seal and rail cap
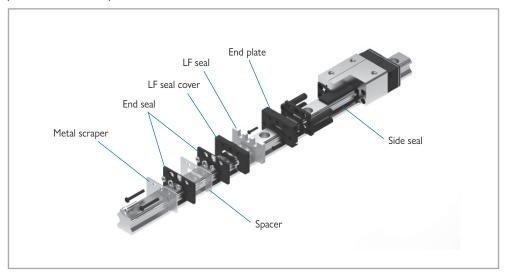

Item	Seal attachment position	Applied environments
End seal	End seal	•Where there is a lot of dust or particles
Side seal	Side seal	•Where foreign substance can easily flow in from the flank or bottom •Where the assembled linear motion guide moves in a vertical, horizontal, or reverse direction
Inner seal	Inner seal	•Where there are a lot of cutting chips or foreign substance •Where cutting chips or foreign substances are highly likely to flow into a block
LF seal	End seal / LF seal / LF seal cover	•Where a long interval of refilling is needed due to a narrow space •An environment at 40°C or so •Where there needs to avoid any contact with organic solvents, such as thinner or milky white oil
Double seal	End seal / End seal / Spacer	•Where strong sealing is needed due to a lot of dust or cutting chips
Metal scarper	Metal scraper	•Where spatters, such as slag or metal powder, arise in welding

*1) In H,HS, H...S, and HS...S Series, the basic optional part of model no. 30 and no. 35 is Inner Seal.
*2) In H Series (model no. 45 and no. 55) and HB Series and R Series, Side Seal and Inner Seal is an integral type.
*3) In R Series, if it is necessary to apply LF seal and metal scrapper, please contact us.

2. Oil inlet

In R Series, it is possible to refill on the side and top. The standard specification of an oil inlet is 'not run through', in order to prevent foreign substances from flowing in a block. For use, please contact WON ST

5. How to install with the use of a support rail

To get a block of a linear motion guide in or out of a rail, it is required to use a support rail for safety. If a rail is mounted on a rail without any support rail, a rolling element can be separated from the block. Moreover, internal parts can be damaged or destroyed by foreign substances.

Installing a block without a rolling element may sharply shorten life of the block, reduce load, and cause early destruction. If you use a support rail, do not lean it. Adhere it to the end of a rail first and then push it in the rail direction by apply force gradually. If a block has a rolling element separated and gets contaminated by dust, please do not use the product but contact WON ST.

CHIARAVALLI
GROUP SpA

14 Precautions for Handling Linear Motion Guide

1. Handling

1) WON Linear Motion Guide is damp-proof packaged after grease removal and cleaning. So, please open it right before use.

2) As for the compatible product of rail and block, a plastic support rail is combined with the block. Please assemble it with the rail carefully.

3) If you reassemble a block-rail set product or a single block product after dismantling it into pieces, foreign substance may intrude into the block or cause performance degradation that leads to unsmooth rolling motion or damage. So please do not disassemble it at your discretion.

4) If either a rail or a block leans to one side, the block or rail may fall to be damaged. Please be careful not to get a block or rail separated.

5) A block' end plate is made of plastic. Imposing an impact on it may cause its damage. Please be careful

2. Lubrication

1) If the product supplied is coated with rust preventive oil, clean it off thoroughly first and then fill with a lubricant before use.

2) DO NOT mix with other lubricants with a different thickener or additive. If so, it may destroy the structure of grease or cause a harmful effect.

3) Viscosity of grease depends on temperature. It increases in winter due to low temperature, and friction of a linear motion guide resistance may increase.

4) If you need to use a special lubricant, please contact WON ST before use.

5) When you use oil as a lubricant, oil may fail to reach the raceway groove depending on the assembly status or direction of a block or rail. In this case, there is no lubrication effect. WON ST offers different lubrication methods suitable for assembly environments. So please contact us.

3. Caution for use

1) After opening the product, please put a damp-proof agent in a dry container for storage.

2) Please handle the product after wearing plastic gloves in a clean place.

3) Please be careful to prevent foreign substances that may impede rolling motion or cause functional damage.

4) Please use a holding door or cover to prevent a linear motion guide from being exposed directly to poor environments that may cause corrosion or damage.

5) As for the linear motion guide based on standard plastic end plate, use it at 80°C or below. If you need to use it at 80°C or above, please order a special metal end plate.

6) If rail of a linear motion guide is fixed at ceiling or in a high place and its block bears load downwards, it is possible for the block to be separated from the rail and for the block and its attached parts to fall as the end plate is damaged or a ball falls off. So, it is required to take safety measures, such as the installation of a safety device.

4. Storage

A rail may warp depending on a storage condition. For storage, place a linear motion guide horizontally in the package box offered by WON ST or its equivalent box with the flat bottom. Avoid a place with high or low temperature and high humidity.

CHIARAVALLI LINEAR CENTER

Troubles and Troubleshooting of Linear Motion Guide

Type	Trouble	Cause	Action
Fatigue failure of the rolling surface	•Flacking - Caused by rolling fatigue of the rolling surface - Maximum shear stress-induced internal cracks are expressed on the surface.	Damage by life	Replace the linear motion guide.
		Overload	Review the model no. selected; Use a higher model no; Lower a level of load; Reinforce assembly precision for installation; Enhance the rigidity of base and table
		Poor lubrication	Refill a lubricant; Shorten a refilling cycle of lubricant; Review the lubricant in use; Improve the lubricant passage.
		Intrusion of foreign substances	Improve seal performance; Add a seal; Take additional measures for dust prevention.
Indentation of the rolling surface	•Indentation - Caused by plastic deformation of the rolling surface due to excessive external load	Impact load or excessive external load	Review the model no. selected; Make service conditions less strict; Lower a level of load; Reinforce assembly precision for installation; Use a higher model no.
		Careless handling	Improve the methods and conditions of handling to prevent impact and fall.
Seizing	•Burning - Rough surface of the rolling surface due to slight burning by friction between a rolling element and the rolling surface - Cause for the discoloration of the rolling surface, weakened hardness, and flaking	Poor lubrication	Refill a lubricant; Use an appropriate lubricant; Improve lubrication
		Overload	Review service conditions; Lower a level of load; Use a higher model no.; Enhance assembly precision for installation.
Cracking	•Cracking - Partial breaking into pieces of a rolling element or rolling surface due to excessive external load	mpact load or excessive external load	Review the model no. selected; Use a higher model no.; Lower a level of load; Reinforce assembly precision for installation
		Poor raceway circulation of a rolling element	Prevent foreign substances; Improve measures for dust prevention; Refill a lubricant; Shorten a refilling cycle of lubricant; Improve lubrication
Abnormal wear	•Abnormal wear - Caused by the sliding of a rolling element and the rolling surface; the more sliding, the rapidly more wear - Accompany oxidation wear causing poor precision and preload failure	Impact load or excessive external load	Review the model no. selected; Use a higher model no.; Lower a level of load; Reinforce assembly precision for installation.
		Intrusion of foreign substances	Reinforce seal performance; Improve measures for dust prevention
		Poor lubrication	Refill a lubricant; Use an appropriate lubricant; Improve lubrication; Improve the lubrication passage.
Flatting corrosion	•Vibration - This problem arises when running at vibrant stroke causes the loss of oil film, and the oxidation of the fine dust caused by the sliding of a rolling element and the rolling surface facilitates wear.	Load	Review service conditions; Use a higher model no.; Reinforce assembly precision for installation.
		Vibration	Improve transfer conditions; Replace a lubricant; Improve lubrication; Shorten a refilling cycle of lubricant.
		Intrusion of foreign substances	Improve a seal; Establish measures for dust prevention.
Rust generation	•Rust - Caused by the loss of oil film or the contact of an exposed part with water, acid, and alkali. In particular, when cooling water flows in a block, it degrades lubrication and causes rust. Early flaking arises due to concentrated stress.	Intrusion of cooling water	Apply surface treatment for rust prevention; Improve seal performance; Replace a lubricant; replace a coolant; Refill a lubricant; Shorten a refilling cycle of lubricant.
		High humidity	Apply surface treatment for rust prevention; Improve environments.
		Poor handling	Improve a storage place; Reinforce sealing treatment; Apply a sufficient amount of rust preventive oil.

CHIARAVALLI GROUP SpA

Crossed Roller Bearing
Contents

1 Structure and Features of WON Crossed Roller Bearing

1. Structure

WON Crossed Roller Bearing has the structure in which a roller as a rolling element is crossed at right angles with the rolling surface with the V-grooved inner ring and outer ring. A spacer-type retainer assembled between rollers prevents the collision and friction of rollers, and the increase in rotational torque. The device has an easy-to-use compact structure.

2. Features

In the rolling surface of the inner and outer rings of a crossed roller bearing, rollers are assembled. Therefore, the device reduces the elastic displacement by external load, and bears all complex loads, such as radial load, axial load, and moment load, at the same time. Since it adopts a spacer retainer, it avoids inclined surface of a roller, uneven wear caused by uneven contact, or hitching. Therefore, the product with high precision and high rigidity implements smooth rotary motion, and support preload adjustment differently depending on service conditions.

3. Use

This product is mainly usable in an environment that needs complex loads, high rigidity and rotational precision. It is applied to various types of equipment, such as industrial robot, machine tool index table, ATC, medical equipment, precise alignment stage, semiconductor manufacture equipment, and DD motor.

Inner ring
Outer ring
Spacer retainer
Roller

Figure 1. Structure of Crossed Roller Bearing

2 Types of Crossed Roller Bearing

1. CB Series for Revolving Inner Ring

1) The inner ring of a crossed roller bearing has an integral type, and its outer ring is separable into upper and lower parts that are bolted for easy handling.
2) This model is mainly applied to the parts that needs the rotational precision of its inner ring, such as the index table of machine tool, or the joint or turning part of industrial robot.

2. CH Series with High Stiffness

1) The inner and outer rings of a crossed roller bearing have an integral type, so that the device has a small installation error. In addition, this model with high precision and high rigidity secures stablerotational precsion.
2) This model is used in an environment where its inner and outer rings need to be rotated simultaneously or individually

3. CA Series for Slim Revolving Inner Ring

1) As a slim compact type, this model has minimum thickness of its inner and outer rings. Its inner ring has an integral type, and its outer ring is separable into upper and lower parts that are bolted for easy handling.
2) This model is mainly applied to the parts that needs the rotational precision of its inner ring and need to become light weight and small, such as the joint or turning part of industrial robot.

4. Customized Special Type CS Series

1) This is a customized model. If you need a special type in terms of the shape, size, material, and specification of the inner and outer rings, please contact WON ST.

3 Selection of Crossed Roller Bearing

1. Overview

To select a crossed roller bearing, it is necessary to identify the details of requirements, prioritize them, and then choose the one that meets the service conditions.

2. Procedure

| 1 | Determine service conditions | | The equipment to be used, requirements, service environments, precision, rigidity, life, and others |

| 2 | Select a type | | Integral type, Inner ring separation type, Outer ring separation type, General type, High rigidity type |

| 3 | Calculate load | | Calculate radial load, axial load, moment load, and dynamic equivalent load |

| 4 | Calculate rated service life | | Calculate a rated service life |

| 5 | Calculate static safety factor | | Calculate a static safety factor in consideration of the characteristics of equipment, external load, etc. |

| 6 | Determine rigidity and preload | | Determine clearance and preload values in consideration of motion conditions, rotational precision, etc. |

| 7 | Determine precision level | | Determine a level of precision in consideration of rotational precision and assembly precision. |

| 8 | Determine lubrication | | Determine oil, grease, or a special lubricant. |

| 9 | Complete selection |

CHIARAVALLI GROUP SpA

4 Life Calculation

1. Rated service life (L)

It is possible to calculate the basic rated life of cross roller bearing in the following formula.

$$L = \left(\frac{f_T \cdot C}{f_w \cdot P_c} \right)^{\frac{10}{3}} \times 10^6$$
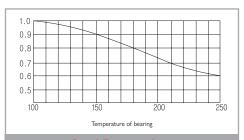

L : Rated service life

C : Basic dynamic load rating(N)

P_c : Dynamic equivalent radial load(N)

f_T : Temperature factor

f_W : Load factor

L_h : Service life time(h)

N : RPM(rpm)

Service life time

$$L_h = \frac{L}{60 \times N}$$

Temperature of bearing

Figure 2. Temperature factor

Note: Usually, workable temperature is 80°C or below.
If above, please contact WON ST.

2. Life calculation under heaving operation condition

Service life of a bearing under heaving operation condition is calculated as follows.

$$L_{0c} = \frac{90}{\theta} \left(\frac{C}{P_c} \right)^P$$

L_{0c} : rated service life 10^6 cycle indicated in heaving frequency of the bearing under heaving operation

θ : heaving angle (See Fig.3.)

P_c : dynamic equivalent radial load

If Ø is small, it is hard to generate an oil film on the contact surface between the raceway surface and a rotating body. In addition, it may cause corrosion.

In case of heaving operation
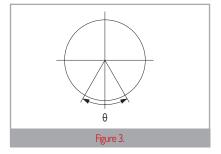

Service life time

$$L_h = \frac{360 \times L}{2 \times \theta \times n_o \times 60}$$

L_h : Service life time   (h)

θ : Heaving angle   (deg)

(See the figure on the right.)

n_o : Number of reciprocating motions (min-1)

Figure 3.

3. Static safety factor (fs)

Static safety factor(fs) of a crossed roller bearing is calculated as follows. For the general static safety factor, see Table 1.

$$f_s = \frac{C_0}{P_0}$$

f_s : static safety factor
C_0 : basic static load rating (N)
P_0 : static equivalent radial load (maximum load) (N)

Table 1. Static safety factor (fs)

Working condition	Lower limit of fs
High rotational precision is required.	≥3
Under normal operation condition	≥2
Almost no rotation and no significance of smooth operation under normal operation condition	≥1

CHIARAVALLI
GROUP SpA

4. Static equivalent radial load (P₀)

Static equivalent radial load of a crossed roller bearing is calculated in the following formula.

$$P_0 = F_r + \frac{2M}{D_{PW}} + 0.44\, F_a$$

P_0 : Static equivalent radial load (N)

F_r : Radial load N)
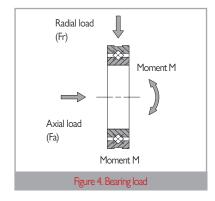

F_a : Axial load(N)

M : Moment(N•mm)

D_{PW} : Roller set pitch diameter(D_{PW} $\frac{d+D}{2}$)

Figure 4. Bearing load

5. Dynamic equivalent radial load (P_c)

Dynamic equivalent radial load of a crossed roller bearing is calculated in the following formula.

$$P_c = X\,(F_r + \frac{2M}{D_{PW}}) + Y\, F_a$$

P_c : Dynamic equivalent radial load(N)

F_r : Radial load(N)

F_a : Axial load(N)

M : Moment(N•mm)

X : Radial load factor (See Table 2.)

Y : Axial load factor (See Table 2.)

D_{PW} : Roller set pitch diameter(D_{PW} $\frac{d+D}{2}$)

Figure 5.
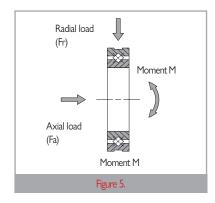

Table 2. Radial load factor and axial load factor

Classification		X	Y
$\dfrac{F_a}{F_r + 2M/D_{PW}}$	≤ 1.5	1	0.45
$\dfrac{F_a}{F_r + 2M/D_{PW}}$	> 1.5	0.67	0.67

6. Load factor (f$_w$)
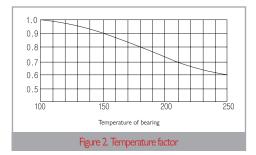

When a crossed roller bearing is used, the load imposed on the bearing by vibration and impacts in operation is often greater than the calculated load. To select a crossed roller bearing, it is required to take into account the load factor values in the table shown below.

Table 3. Load factor (fw)

Load condition	fw		
Smooth operation condition without impacts	1	~	1.2
Normal operation condition	1.2	~	1.5
The operation condition with both vibration load and impact load	1.5	~	3

7. Temperature factor (f$_T$)

Temperature factor is presented in the following graph.

Figure 2. Temperature factor

Note: Usually, workable temperature is 80°C or below.
If above, please contact WON ST

---

5 | Load rating

1. Basic dynamic load rating (C)

It refers to the radial load with a constant size and direction, which makes it possible to meet the condition where over 90% in the group of multiple crossed roller bearings with the same model have no flaking and can rotate a million times.

2. Basic static load rating (C$_O$)

It refers to the static radial load that imposes a certain level of contact stress on the raceway surface with the maximum load and on the center of the contact part of a rotating body in a crossed roller bearing.

6 Permissible RPM

For the permissible RPM of a crossed roller bearing, see the table below.
A permissible RPM depends on assembly or service conditions.

Table 4. Permissible RPM of crossed roller bearing (dm•n)

Bearing	Type	Seal	Grease lubrication	Oil lubrication
Bearing		No seal	75,000	150,000
Spacer retainer		Seals on the both sides	60,000	-

dm•n = dm X n

dm : The mean value of inside
and outside dimeters (mm)

n : Revolution count (rpm)

7 Lubrication

A crossed roller bearing is commonly lubricated with grease. An oil inlet of the inner ring and outer ring is used for grease supply. A crossed roller bearing with double-sided seal mounting type is filled with Albania EP2 grease.
If a bearing is not filled with a lubricant, please fill it with the grease or oil suitable for service conditions before use. Without lubrication, it is possible to make the rolling surface worn out more and shorten of a bearing life.

8 Cautions in Designing Compression Plate and Housing

A crossed roller bearing is compact and slim. It is required to evaluate the rigidity of a pressure plate or housing plate and the torque of bolts in the process of designing an installation part.
In the case of poor rigidity, it is impossible to assemble the inner and outer rings of a bearing evenly and tightly, and the bearing can be deformed in moment load. In such deformation, a roller fails to make contact uniform and thus performance of the bearing is degraded significantly.

1. Housing design for installation

Housing thickness should be at least 60% of cross-section height of a bearing.

$$T = \frac{D-d}{2} \times 0.6 \text{ or more}$$
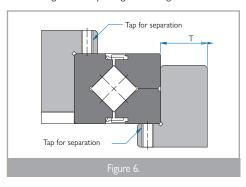

T : Housing thickness

D : The outside diameter of the outer ring

d : The outside diameter of the inner ring
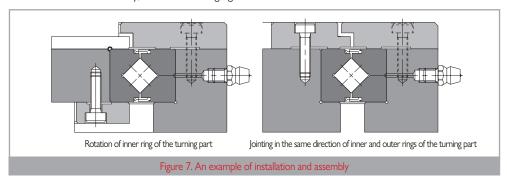

2. Tap for separation

If a separation tap is applied to a design, it is easy to separate the inner and outer rings without any damage to a bearing.

Tap for separation

T

Tap for separation

Figure 6.

3. Installation and assembly

For installation and assembly, see the following figure.

Rotation of inner ring of the turning part   Jointing in the same direction of inner and outer rings of the turning part

Figure 7. An example of installation and assembly

4. Selection of compression flange and bolt

The more numbers of the fastening bolts for compression, the more stable. Bolts are arranged in the equimultiples as shown in Table 5. For the thickness (F) and gap (S) of the flange for compression, see the following table of dimensions

$F = B \times 0.5 \sim B \times 1.2$

$H = B_{-0.1}^{0}$

$S = 0.5mm$

To prevent a flange for compression from being loosened, it is required to make firm connection in an appropriate torque level. If a shaft or housing is made of a light alloy material, use steel. For general heavy or light steel, see the following table.
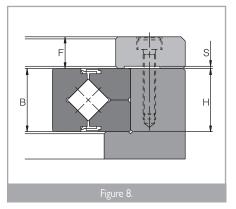

Table 5. Number of compression bolts and bolt size   Unit : mm

external diameter of outer ring		No. of bolts	Bolt size
Above	Below		
-	100	8 or more	M3 ~ M5
100	200	12 or more	M4 ~ M8
200	300	16 or more	M5 ~ M12

Table 6. Maximum clamping torque of bolts   Unit : N•m

Bolt No.	Clamping torque	Bolt No.	Clamping torque
M3	2	M8	30
M4	4	M10	70
M5	9	M12	120
M6	14	-	-

Figure 8.

CHIARAVALLI GROUP SpA

5. Assembly procedure for installation

The assembly procedure of a crossed roller bearing is as follows.
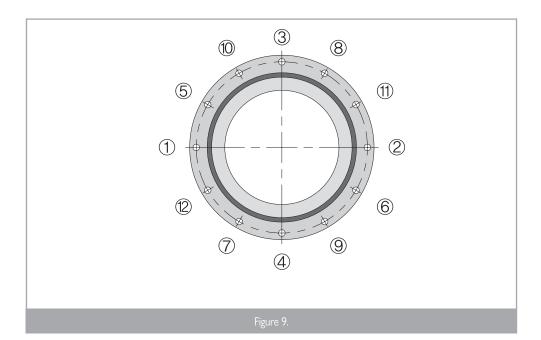

1. Preliminary check before mounting
Wash a housing or other assembly parts clearly and check if they have any scratch or sharp edge.

2. Axis or housing assembly
Since a bearing is slim, it can be easily inclined in the process of assembly. Make it balanced horizontally with the use of a plastic hammer, and then hammer the cylinder of the outer ring gradually and insert it. Carefully hammer it until the part is set in the contact surface completely.

3. Compression-flange mounting
1) Mount a flange for compression. Check a position for bolt fastening by shaking the flange before assembly.
2) Check that a bolt is positioned well in a hole before fastening the bolt.
3) The bolt fastening process is comprised of 2 to 5 steps from temporary fastening to complete fastening. If the inner ring and outer ring are separated from each other, rotate the integral axis gently and slowly in order to secure an assembly position, and then fasten a bolt in 2 to 5 steps.

Figure 9.

9 Fitting

For fitting, see the following table

Table 7. Recommended fitting in normal load

Radial internal clearance	Tolerance range class			
	Load fixed to inner ring		Load fixed to outer ring	
	Shaft	Housing bore	Shaft	Housing bore
G2 clearance	h5	H7	g5	J7[1]
G1 clearance	j5	H7	g5	J7[1]

Note[1] It is recommended to fit to a small edge according to measured value of a bearing.

Table8. Recommended fitting for the normal clearance of a slim type

Note[1]: Standard precision of the inside diameter of CH series is class 0. For higher precision, please contact WON ST.
Note[2]: dm is the mean value between the max diameter and min diameter of the 2-point measurement values of bearing inside diameter.
Note[3]: In case of no indication of precision class, the highest of the low precision classes is applied.

Table 14. Dimensional tolerance of the outside diameter of bearing   Unit :

Nominal dimension (mm) of the inside diameter (d) of bearing		Tolerance of dm Note (2)							
		0,P6,P5,P4,P2,WUP		PE6		PE5		PE4, PE2

11 Precision Specification of WUP-class Series

1. Rotational precision of WUP-class series (example)

WUP-class Series has higher rotational precision than those of ISO Class2, KS 2, DIN P2, AFBMA ABCE9, and JIS2.

2. Precision specification

The runout precision of CH, CB and WUP-class crossed roller bearing series is based on the Table 17 and Table 18.

Table 17. Runout precision of CH and WUP-class series   Unit :

Model No.	Runout precision of the inner ring of CH series		Runout precision of the outer ring of CH series	
	Radial runout tolerance	Axis runout tolerance	Radial runout tolerance	Axis runout tolerance
CH42	2	2	3	3
CH66	2	2	3	3
CH85	2	2	3	3
CH124	2	2	3	3
CH148	2	2	4	4
CH178	2	2	4	4
CH228	2.5	2.5	4	4
CH297	3	3	5	5
CH445	4	4	7	7

Table 18. Runout precision of CB and WUP-class series   Unit :

Nominal dimensions (mm) of the inner diameter (d) and outside diameter (D)		Runout precision of the inner ring of CB series	
Above	Below	Radial runout tolerance	Axis runout tolerance
80	180	2.5	2.5
180	250	3	3
250	315	4	4
315	400	4	4
400	500	5	5
500	630	6	6
630	800	-	-

12 Radial Clearance

The radial clearance of CH, CB, and CA series is shown in the following tables

Table 19. Radial clearance of CH series

Unit :

Model No.	G3		G2	
	Starting torque (N•m)		Radial clearance ( )	
	Min.	Max.	Min.	Max.
CH42	0.1	0.5	0	25
CH66	0.3	2.2	0	30
CH85	0.4	3	0	40
CH124	1	6	0	40
CH148	1	10	0	40
CH178	3	15	0	50
CH228	5	20	0	60
CH297	10	35	0	70
CH445	20	55	0	100

Note: G3 clearance of CH series is controlled by starting torque, and
the starting torque of G3 clearance has no seal resistance.

Table 20. Radial clearance of CB and WUP-class series

Unit :

14 Precautions for Handling Crossed Roller Bearing

1. If the assembly part for installation fails to have sufficient rigidity, the contact part of the rollers has intensive stress that severely degrades the performance of a bearing. In an environment with large moment, it is required to evaluate the rigidity of housing and bolts in the process of design.

2. Some parts of a crossed roller bearing are made of special synthetic rubber and synthetic resin. For the use at above 80°C, please contact WONST.

3. It is required to manage dimensional tolerance of assembly parts according to standards in order to make the inner and outer rings in tight contact with the sides.

4. A crossed roller bearing may be damaged by its fall or hit. Any impact to the bearing may cause functional loss even if there is no damage to its appearance. Be careful to handle the product.

5. If foreign substances flow in a crossed roller bearing, they may cause its functional loss. It is required to take measures to prevent cutting chips or dust from intruding in the device.

6. A crossed roller bearing is already filled with lithium soap grease at the time of shipment. So, it can be used without refilling at the time of assembly. It is necessary to connect a lubrication hole with the oil inlet of the inner or outer ring. Regardless of rotation frequency, it is required to refill enough not for a lubricant to ooze out in the cycle of six months to one year.

7. Avoid lubricants with different thickeners or additives, if possible.

8. If you need to use the product in a place with impact or vibration load, in cleanroom, or in a special environment with vacuum, low temperature, or high temperature. please contact WON ST.

CHIARAVALLI GROUP SpA

WON
LINEAR MOTION SYSTEM

Ball Spline
Contents

CHIARAVALLI GROUP SpA

1 WON Ball Spline

1. Structure and Features

WON Ball Spline consists of a nut and a shaft. The ball of the nut has a rolling linear motion along the groove of the precisely-ground spline shaft. The spline has the linear motion to deliver torque in the circu
mferential direction of the shaft. Based on one nut, the device exerts high performance in the radial directi
on, in an environment with vibration and impact load, in an environment that requires high positioning precision, or in an environment that needs high-speed motion.

2. Transmission of high torque
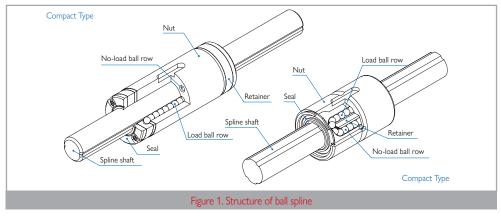

A spline groove is precisely ground in the shape close to a ball diameter. For this reason, if torque load is imposed on a shaft or nut, it is evenly applied to two rows of the ball in the torque load direction in the transmission of rotatory force.

3. High load capacity and long life

WON Ball Spline can be designed to be compact. It ensures high stability and long life in an environment with high load or torsional load.

4. Zero gap

Since a ball spline minimizes the gap of the rotational direction, and, if necessary, imposes preload on one spline nut to make clearance zero, it can have a small displacement value and obtain high rigidity and high positioning precision.

Figure 1. Structure of ball spline

Ball Spline	Compact Ball Spline	- 2 rows and 4 points contact type - Simple structure and very compact type
	Linear Ball Spline	- 4 rows and 2 points contact type - Angular contact type, and high load rating in radial direction and torque direction

2 | Selection of Ball Spline

1. Overview

To select a ball spline, it is necessary to identify the details of requirements, prioritize them, and then choose the one that meets the service conditions.

2. Procedure

1	Determine service conditions		The equipment to be used, maintenance structure, installation space, assembly state, functional requirements, service environments
2	Select a type		Determine an appropriate type in consideration of motion conditions, load magnitude, rigidity, friction, and assembly.
3	Select a model number		Determine an appropriate model number and a quantity of nuts in consideration of the assembled space, load, etc.
4	Calculate load		Calculate the vertical, horizontal, and moment load imposed on nut and shaft, a critical speed of shaft, an operating speed of shaft, etc.
5	Calculate equivalent load		Convert each load imposed on nut and shaft into equivalent load.
6	Calculate mean load		Convert each load imposed on nut and shaft and the variable load at deceleration & acceleration into mean load.
7	Calculate static safety factor		Calculate the static safety factor with basic load rating and maximum equivalent load, and check if the calculated value meets a service condition.
8	Calculate life		Calculate load rating and life, and check if the calculated values meet service conditions.
9	Review preload and clearance		Determine the preload and clearance that meet service conditions.
10	Determine a class of precision		Determine a class of precision for the travel or rotation that a ball spline needs.
11	Lubrication, dust proof, and surface treatment		Determine a grease lubricant, oil lubricant, or a special lubricant suitable for an environment. Select a dust-proof seal/ Determine the surface treatment for dust proof and low dust generation.
12	Complete selection		Determine the final specifications of a ball spline.

3 Life Calculation

1. Life

When a ball spline runs in the course of bearing external load, the stress, which arises when the raceway surface of nut and axis and a rolling element bear continuously repeated load, causes fatigue failure and leads to flaking. Life of a ball spline refers to a total travel distance until the point that flaking arises due to initial fatigue failure.

• A ball spline can have defects earlier than the time of normal flaking caused by its wear or
  fatigue in the following cases

a. Excess load by the imprecise assembly following a difference in temperature or tolerance

b. If a ball spline is contaminated with foreign substances

c. Driving with insufficient lubrication

d. Reciprocating motion in a very short distance in the form of vibration or wave during halting or driving

e. Excessive load or rotational torque imposed on a ball spline

f. Deformation of plastic end-plate

2. Rating fatigue life L

Generally Ball Spline does not always have an equal life span even though its products are manufactured in the same way, because of the difference in scattering of original fatigue of raw material. For this reason, the reference value of life of a ball spline is defined as the rating fatigue life which is a total driving distance that 90% of ball splines in one group with the same specifications can reach without flaking at the time when all in the group run under the same conditions.

Radial load

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P_C} \right)^3 \times 50\,km$$

Torque load

$$L = \left(\frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{T}{P_T} \right)^3 \times 50\,km$$

$$L_h = \frac{10^3 \cdot L}{2 \times \ell_S \times n_1 \times 60}$$
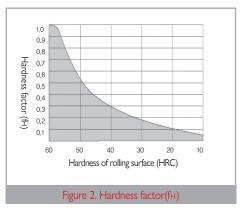

L   : Rated life (km)
C   : Basic dynamic rated load (N)
T   : Basic dynamic rated torque (N m)
P_C : Calculated load (N)
P_T : Calculated torque (N m)
f_H : Hardness factor (See Figure 2.)
f_T : Temperature factor (See Figure 3.)
f_C : Contact factor (See Table 2.)
f_W : Load factor (See Table 3.)

L_h : Life time (h)
ℓ_S : Stroke length (m)
n_1 : No. of reciprocating motions per minute (min⁻¹)

• Hardness factor (fH)

To implement the best performance of a ball spline, it is necessary to maintain appropriately the hardness and depth of the raceway surface of the nut and shaft that contact a ball as a rolling element.
WON Ball Spline has HRC58-64 surface hardness. There is no need to consider hardness factor.
If the hardness is lowered than a baseline, load capacity of a ball spline decreases. In this case, it is necessary to apply hardness factor to life calculation
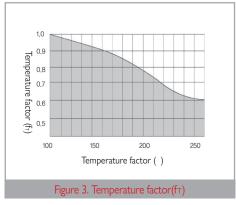

Figure 2. Hardness factor(fH)

• Temperature factor (fT)

If high temperature over 100°C is applied to a ball spline, it is necessary to take into
account the temperature factor (fT) shown in the figure at the time when a ball spline is
selected. For use at over 80°C, please contact WON ST.

Figure 3. Temperature factor(fT)

Note) If ambient temperature is over 80°C, it is necessary to change the material of seal, end plate, and support plate to the one which meets the specifications for high temperature.

• Contact factor (fc)

If over two blocks of a ball splines are closely assembled and mounted, uniform load may not be applied to them due to difference among mounting surfaces. Therefore, it is required to multiply basic static load rating (C) and basic dynamic load rating (Co) by the contact factor shown in Table 1.

Table 2. Contact factor (fc)

No. of nuts in close contact	Contact factor fc
2	0.81
3	0.72
4	0.66
5	0.61
Over 6	0.6
Common use	1.0

• Load factor (fw)

Generally the static load applied to the nut of a linear motion guide can be calculated in formula. However, while a machine is running, the load imposed on the nut tends to come from vibration or impacts. Therefore, as for the vibration or impact load at high-speed running, it is necessary to divide the basic dynamic load rating of a ball spline by the load factor (fw) shown in Table 3.

Table 3. Load facto (fw)

External condition	Service conditions	Load factor(fw)
Low	Smooth running at mild speed; no external vibration or impacts	1.0 ~ 1.3
Moderate	Moderate - Low speed; moderate external vibration or impacts	1.2 ~ 1.5
High	High - High speed; strong vibration or impacts	1.5 ~ 2.0
Very high	Very high - Very high speed; strong vibration and impacts at running	2.0 ~ 4.0

3. Static Safety Factor fs

If heavy load or big impact is imposed on a ball spline, its rolling element and raceway surface have local and permanent deformation that leads to lowering its running performance. Limit of a ball spline depends on its service conditions and requirements.

In this case, the static safety factor fs is calculated in the following formula, and its general values are presented in Table 4.

$$fs = \frac{Co}{Pro} \text{ 또는 } fs = \frac{To}{Pto}$$

fs : Static safety factor
Co : Basic static rated load (N)
To : Basic static rated torque (N m)
Pro : Calculated load (N)
Pto : Calculated torque (N m)

Table 4. Static safety factor (fs)

Service condition	safety factor (fs)
Vibration and impacts	3 ~ 5
High running	2 ~ 4
Normal operation	1 ~ 3

4. Basic Dynamic Load Rating (C)

Basic dynamic load rating is ability of a ball spline to bear load, which represents an applicable constant load in direction and magnitude when the rated fatigue life is 50km. The reference value of basic dynamic load rating of WON Ball Spline is 50km (ball type). It is used for calculating life of a ball spline while driving under constant load in magnitude from the center of a nut to bottom.

Each value of basic dynamic load rating (C) is described in the catalogue.

5. Basic static load rating C_0

If a ball spline is applied by excessive load or instantly by big impact load, partially permanent deformation occurs between a rolling element and the raceway surface. If deformation reaches to a certain extent, it hinders smooth driving.

Basic static load rating is defined as the constant static load in direction and magnitude when the total permanent deformation of the raceway surface of nut and shaft and a ball as a rolling element is 0.0001 times bigger than the diameter of the rolling element.
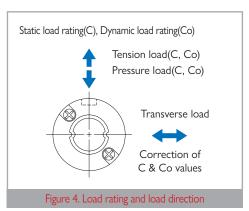

In a ball spline, it refers to the load in radial direction on the center of the contact of nut and ball. Each value of basic static load rating (C_0) is described in the specification table.
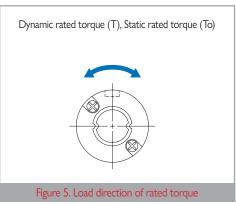

6. Basic Dynamic Rated Torque T

Load rated torque refers to the constant torque in direction and size in the condition where 90% in one group of ball splines with the same specification travel 50km without material damage (flaking). See Figure 5.

7. Basic Static Rated Torque T_0 □ Basic Static Rated Moment T_M

Basic static torque and basic static moment refer to the static torque and moment that can face a certain amount of contact stress at the center of the contact of the rolling element with the maximum load and the raceway surface, when torque or moment load is imposed on. The TM described in the table of dimensions is the basic static rated moment of one sleeve and of two sleeves in close contact.

Figure 5. Load direction of rated torque

A compact-type ball spline is used after load rating is corrected in the direction of load.

The basic dynamic load rating and basic static load rating shown in the table of dimensions are corrected according to the following table.

(Basic dynamic rated torque, basic static rated torque and basic rated moment are also corrected in the same multiple.)

Size	Basic dynamic load rating			Basic static load rating		
	Pressure load	Tension load	Transverse load	Pressure load	Tension load	Transverse load
4~12	C	C	$1.73\,C_0$	C_0	C_0	$1.73\,C_0$
15~40	C	C	$1.19\,C_0$	C_0	C_0	$1.19\,C_0$

CHIARAVALLI
GROUP SpA

4 Preload of Ball Spine

Preload

A ball spline can be preloaded differently depending on service conditions. In order to increase rigidity of a ball spline and lessen the displacement for external load, it is possible to preload the device in the way of removing a gap with the use of the ball (as a rolling element) inserted in between a shaft and a nut, or inserting a ball larger than the gap between the shaft and nut.

If vibration or variable load is imposed on and high rigidity are needed, it is necessary to determine the preload suitable for service conditions in consideration of life of a ball spline.

Table 5. Preload

External condition	Symbol	Preload (N)	Applied equipment
Zero preload	CL	$0^{(1)} \sim +$	•Mechanical equipment requiring light running with small torque
Standard	CM	$0^{(2)} \sim -$	•General mechanical equipment •Mechanical equipment requiring small motion resistance
Light preload	CT	$0.02Co$	•Mechanical equipment requiring rigidity •Mechanical equipment to which large vibration or impact load is applied •Mechanical equipment to which big moment load or variable load is applied

Note. (1) Zero preload   Remark: Light preload is not applied to WSP (F) (K) 4.
       (2)Zero or a little of preload

5 Precision

Precision of a ball spline is related to its outside diameter of nut runout on the basis of shaft. WON Ball Spline has the precision of KS B 1422(JIS B 1193).

The precision of ball spline is categorized into three classes: normal (no symbol), high (H), and precision (P).

A class of precision is described according to the arrangement of a model number.

The values in the tables include the precision in the case where the shaft ends are processed.

For the precision class of ball spline, see tables 6, 7, and 8.

WON ST also manufactures a product that has higher precision than in the tables, or a product with a special shape at request of a customer. If necessary, please contact us.

6 Lubrication and Dust Resistance

A ball spline has the treatment with anti-rust additives that has affinity with all mineral oils.

It can be lubricated with oil or grease. Grease lubrication generates an additional sealing effect, and sticks well in a ball spline. Therefore, it is recommended to use grease.

In case of grease refilling, it is necessary to use a ball spline whose nut has an oil hole. WON Ball Spline is dust resistant through its special rubber seal. Nevertheless, if a lot of foreign substances or dust float, it is recommended to attach an anti-dust device to protect a spline shaft against relatively large impurities like cutting chips or sand.

Bellow   Cover

Figure 7. An example of anti-dust device

Figure 8. An example of refilling device

7 Assembly

Nut fitting
As for nut and housing fitting, WON Ball Spline has a transition fit (J7).
If precision and rigidity are not needed much, it is possible to apply a clearance fit (H7).
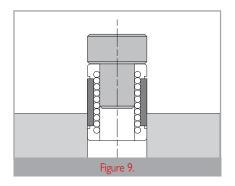

Insertion of spline nut
Inserting a spline nut into a housing may affect the operation of a device. In order to prevent any impact from being imposed on a retainer, use a jig for installation as shown in the following figure when inserting the nut.

Insertion of spline shaft
When a spline shaft is inserted into a spline nut, a ball may come out. Therefore, set raceway groove of the shaft, ball row of the spline nut, and position of a seal rightly before insertion.

Figure 9.
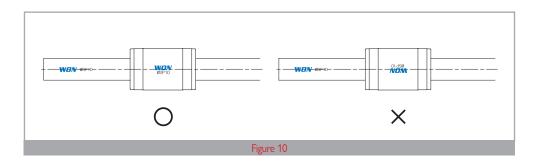

8 Caution for Use

The working temperature of WON Ball Spline is max. 120°C in case of discontinuous use, and max. 80°C for continuous use. If above 80°C, please contact WON ST.

WON Ball Spline is set to optimal precision in the condition where its spline shaft and nut mark are in the same direction and position (See Figure 10). To attach it to a machine, it is careful not to change steering of a spline shaft, arrangement of a nut, and a steering direction.

If more than two keys are used to fix the rotation direction of an outer sleeve on the basis of one shaft and over two nuts, it is required to make the position of each key groove of nut in parallel. For this case, please contact WON ST.

Figure 10

9 Compact Ball Spline

1. Structure and Features

WON Ball Spline is composed of a nut and a shaft. The nut has a ball as a rolling element installed in. The rolling surface of the shaft has a Gothic arch shaped groove processed. The ball of the nut rolls in a linear line along the precisely polished groove of the rolling surface.
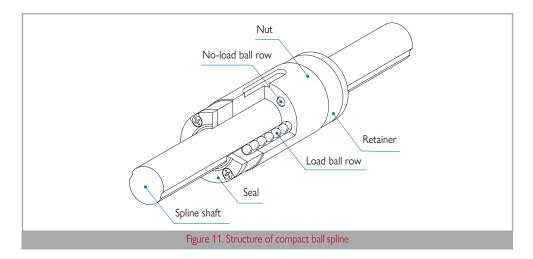

With one nut, the device can bear radial load and moment load and can transmit rotational torque in the circumferential direction of the shaft. With the use of the ball in between the raceways of nut and shaft, it is possible to apply preload. For this reason, the ball spline is strongly resistant for vibration or impact load. The linear motion system is applicable to an environment that needs high positioning precision, high-speed motion, and a long life span.

2. Transmission of high torque

A ball spline have Gothic arch shaped grooves in two rows on the rolling surface of nut and the rolling surface of shaft, which are precisely polished. Therefore, a ball can contact four points. Thanks to such a structure, it is possible to let the two rows evenly bear the rotational torque of nut and transmit rotational force.

3. High load capacity and long life

A ball spline has a linear type and has the structure of contact between the rolling surface of nut and shaft, and a ball as a rolling element. In the condition diameter of a shaft is equal, the device is capable of bearing rated load about ten times more than a ball bushing, ensuring a long life span. Therefore, it supports a compact design of equipment and bears moment load and overhang load as well as radial load.

Figure 11. Structure of compact ball spline

CHIARAVALLI®
LINEAR CENTER
Classification	Type	Shape and Features	
Cylinder Type	WSP WSPL		It has a general spline nut that has a key groove helping to fix the position of a rotational direction accurately.
	WSP WSPL		Since a retainer is placed inside, this ball spline has good appearance and rigidity.
Flange Type	WSPF WSPFL		As a round flange type, it can be installed easily.
	WSPK WSPKL		As a square flange type, it can be installed easily.
	WSPTF WSPTFO		As a round flange type, it can be installed easily.

10 Linear Ball Spline

1. Structure and Features

WON Linear Ball Spline is composed of a spline shaft with a groove and a nut. The spline nut has a retainer, a seal, and a ball installed in. It supports smooth motion.

2. High load capacity and long life

The raceway surface an R-shape similar to diameter of a ball. Since it is precisely polished, it has a wide area of contact with a ball. Therefore, the device a high load capacity and a long life span.

3. Torque transmission with high precision

The groove of shaft and cylinder adjusts a ball at an appropriate contact angle. Therefore, with one shaft, it is possible to transmit torque.
In addition, by setting the gap of the rotation direction for preload to zero, it is possible to increase rigidity and determine an accurate position of rotation.

4. High speed movement and high speed rotation

The cylinder of a linear ball spline is compact and is balanced well. Therefore, it has good performance in high-speed motion or high-speed rotation.
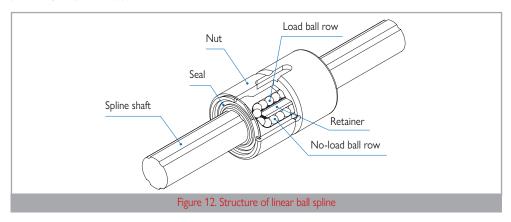

5. Product components

WON Linear Ball Spline has eight different types (8 to 40) of sizes, and has two different types of nut shapes (cylinder type: WLS, flange type: WLSF).
If you need a linear ball spline with a different material, please contact us.

6. Easy further processing

WON Linear Ball Spline has a groove installed in its round shaft. Therefore, the device supports multiple types of processing easily and is applicable in wide areas.
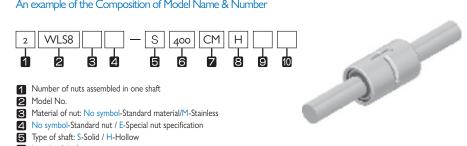

Figure 12. Structure of linear ball spline

Classification	Type	Shape and Features
Cylinder Type	WLS	It has a general spline nut that has a key groove helping to fix the position of a rotational direction accurately.
Flange Type	WLSF	Flange Type - As a round flange type, it can be installed easily.

It is possible to select a different type of WON Linear Ball Spline depending on a use. A seal is basically installed in any type of nut.

1 Structure and Features of Cross Roller Guide Way

WON Cross Roller Guide Way is composed of the race rail and roller cage precisely polished. For use, the roller cages assembled in the reverse direction of precise roller are put together with the 90°V grooved raceway surface of a race rail. The device has the non-circular and highly-precise linear motion system with low frictional resistance. It is mainly applied to electric discharge machine, optical equipment, measuring equipment, and electronic parts assembly & inspection equipment.

1. Precise and fine linear motion
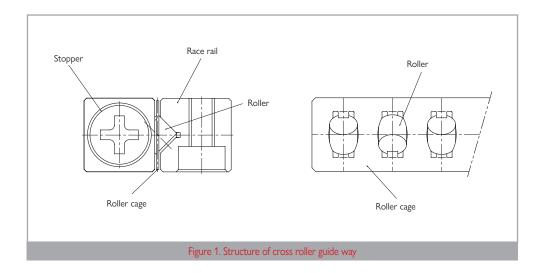

A cross roller guide way has very low frictional resistance and almost no static and dynamic frictional resistance. Therefore, it supports precise and fine linear motion, obtaining stable linear motion in the conditions of light load and low speed.

2. Low noise

WON Cross Roller Guide Way has a non-circular linear motion system. Therefore, it has no noise of circulation part. Since its roller cage supports a roller at a certain interval, the device runs smoothly without any noise of contact between rollers. .

3. High load capacity
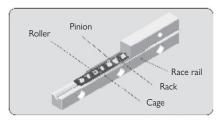

Since a cross roller guide way uses a precise roller as a rolling element, it has high rigidity and a high load capacity.

Figure 1. Structure of cross roller guide way
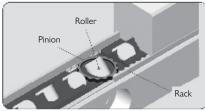

2 | WON Anti-Creep Structures and Features of Anti-Creep Cross Roller Guide Way

WON Anti-Creep Cross Roller Guide Way is the product with the rack and pinion gear built in a conventional cross roller guide way. Therefore, it has very high precision and the anti-creep protection.

Structure of WON Anti-Creep cross roller guide way

Details of Anti-Creep part

1. Responses to multiple types of operation
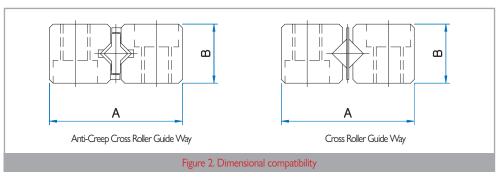

The anti-creep function makes it possible to respond to very high deceleration and acceleration. Unlike a conventional cross roller guide way, this device is safely applicable in difficult service conditions like vertical axis.

2. Low noise and smooth motion

This product adopts a resin cage, rather than a steel cage applied to our other products, in order to minimize the noise of friction between a case and a roller and to implement quit and smooth running.

3. High load capacity based on complete compatibility of installation

This product has a unique structure in which a pinion gear wraps of roller a cage. It has the same quantity of rollers and the same load rating and stroke assembly dimension as a general cross roller guide way, so that it has good compatibility for convenient replacement.[1]

Anti-Creep Cross Roller Guide Way

Cross Roller Guide Way

Figure 2. Dimensional compatibility

Note [1] The model numbers 1 & 2 have a different quantity of rollers.

3 Types and Features

Shape & Feature

Guide	Roll Cage		In WRG type, the roller cage with the precision rollers crossed at a right angle is put together with the 90°V-grooved raceway of an exclusive rail. By mounting two-roll roller guides in parallel, it is possible to bear any load in all directions, which is imposed on the shaft at a right angle. In addition, since preload can be applied simply, the cross roller guide way can become a light sliding device with no clearance and high rigi dity.
	WRG WRGO WRG-AC		
Table	WRGW		
	WRGT		A cross roller table is the compact, highly precise and highly rigid unit guiding a finite linear line. A cross roller guide way is put in between a highly precise table and the base.
	WRGU WR-GU-AC		

4 Precision

Precision of WON Cross Roller Guide Way is classified into normal, precision, and super precision types.
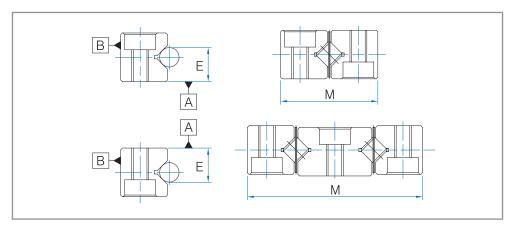

Table 1. Precision of each part of the race rail   Unit : mm

Class of precision Item	Symbol	Normal	Precision	Super Precision
		No symbol	H	P
Parallelism of the race rail for & sides		See Table 2.		
Dimensional tolerance of the height E		±0.02		±0.01
Difference of the height E		0.02	0.01	0.005
Tolerance of M		0 −0.2		0 −0.1

Table 2. Parallelism of the race rail for & sides   Unit : mm

Class of precision Length of race rail	Normal (No symbol)	Precision (H)	Super Precision (P)
Length > 200	8	4	2
200 ≤ length > 400	10	5	3
400 ≤ length > 600	14	7	4
600 ≤ length > 800	15	9	5
800 ≤ length	20	10	5

Note) The difference of the height E is applied to
four race rails used on the same plane.

5 Load rating and life

As for the basic load rating C and Co, the basic load rating of the running-roller count (Z) actually applied is calculated with the basic load rating Cz and Coz equivalent to one running roller.

Basic dynamic load rating

$$C = \left(\frac{Z}{2}\right)^{\frac{3}{4}} \cdot Cz$$

Basic static load rating

$$Co = \left(\frac{Z}{2}\right) \cdot Coz$$

$$\text{※} \left(\frac{Z}{2}\right) = \text{Removal of decimals}$$

Rating life refers to a total travel distance that 90% in one group of linear motion systems, each of which runs under the same condition, can reach without flaking. After the basic dynamic load rating is calculated in the above formula, it is possible to calculate the life of a cross roller guide way in the following formula.

$$L = \left[\left(\frac{f_H \cdot f_T}{f_W}\right) \cdot \left(\frac{C}{P_C}\right)\right]^{\frac{10}{3}} \cdot 100$$

Where L   : basic load rating   (km)
       C   : basic dynamic load rating   (kN)
       P_C : Calculated load   (kN)
       f_H : Hardness factor
       f_T : Temperature factor
       f_W : Load factor

If stroke length and the number of strokes per minute are given, it is possible to calculate a service life in the following formula.

$$L_h = \frac{L \times 10^3}{2 \times \ell_s \times n_1 \times 60}$$

Where L_h : Rating life   (hr)
       ℓ_s : Stroke length   (m)
       n_1 : Number of strokes per minute   (o.p.m.)

Table 3. Hardness factor

A type of race rail	f_H
Carbon steel race rail	1
Stainless steel race rail	0.8

Table 4. Temperature factor

Temperature of linear motion system (°C)	f_T
100	1.00
120	0.97
140	0.93
160	0.88
180	0.82

Table 5. Load factor

Impacts & vibration	Velocity (V)	Measured value of vibration (G)	f_W
No external impacts and vibration	Low speed $V \leqq 15m/mim$	$G \leqq 0.5$	1.0 ~ 1.5
Very weak impacts and vibration	Middle speed $15 < V \leqq 60m/mim$	$0.5 \leqq G \leqq 1.0$	1.5 ~ 2.0
External impacts and vibration	High speed $V > 60m/mim$	$1.0 \leqq G \leqq 2.0$	2.0 ~ 3.5

6 Preload
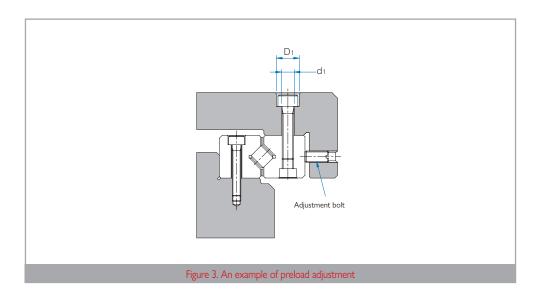

If a cross roller guide way has no appropriate level of preload, it is impossible to obtain the precision needed, or it is possible to cause scratches or shorten its service life. Therefore, fasten an adjustment bolt by checking an allowable preload level.

(* Adjust an adjustment bolt in the same line with a roller.)

Table 6. Allowable preload level of roller cage in the row 1   Unit :

Model No.	R1	R2	R3	R4	R5	R9
Allowable preload	-2	-3	-4	-5	-7	-10

D_1
d_1

Adjustment bolt

Figure 3. An example of preload adjustment
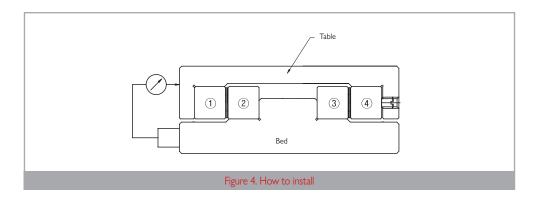

7 Precision of mounting surface

To obtain a certain level of travel precision, it is required for the mounting face of a race rail to secure more than a level of precision described in Table 1. Generally, polishing process is applied.

8 How to install

Figure 4. How to install

1) Place the mounting surfaces of the race rails , , and   closely and accurately on the bed and table and connect them completely.
2) Connect the race rail   temporarily with the table and secure a gap enough to push a roller cage into the side.
3) Set a dial gauge as shown in Figure 4. Lightly fasten an adjustment bolt until the table has no runout in order to obtain a certain amount of stroke. Set the dial gauge to zero.
4) Place the roller cage at the center as shown in Figure 5. Fasten the adjustment bolt with a torque wrench until the dial gauge shows a certain amount of displacement that represents an allowable preload level. Fasten the mounting bolt of the race rail   completely.
5) Slide the table left and right and fasten another adjustment bolt and mounting bolt (a,e) in the same way as above. Now the installation is complete.
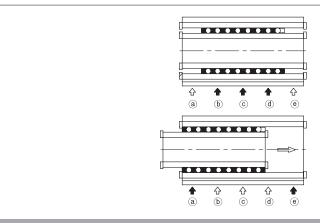

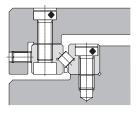

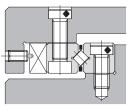

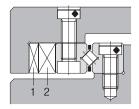

Figure 5. Procedure of fastening an adjustment bolt

Generally, push the rail with the adjustment bolt.

If precision and rigidity are needed, use a holding bar.

In particular, if high precision and high rigidity are needed, use tapered gibs 1 and 2.

Figure 6. An example of clearance adjustment
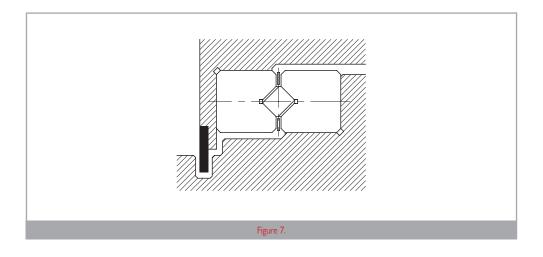

9 Lubrication and Dust Proof

WON Cross Roller Guide Way (WRGT, WRGU) is already filled with lithium grease. If you need to refill, it is recommended to use the same type of grease.

If a large amount of foreign substances or dust float, or if a cross roller guide way is exposed to relatively big foreign substances like cutting tips or sand, it is recommended to attach a cover to protect the device.

Figure 7.

10 | Caution for Use

1. Installation

If the mounting surface is polished with lower than a required level of precision, or an inappropriate preload level is applied, a race rail can face torsion. In this case, asymmetric load, race rail wear, and a shortened service life occur. Therefore, it is recommended to meet the required precision of the polished surface and level of preload.

2. Stopper

Stoppers are installed on both ends of a race rail only for the purpose of preventing the separation of a roller cage. Therefore, it is required to install a table stopper separately.

3. Use of an equal set

As for WON Cross Roller Guide Way, WRG type has one set of four race rails, and WRGW type one set of three race rails.
The V-groove difference of each type is adjusted in the set. Therefore, a combination of different sets can cause an error that degrades precision and shortens a service life. Be careful.
